TYPOGRAPHVS ASTROPHILIS
S. D.

Reclare Plato in Epinomide literis prodidit: Gratam de Deo
famam in astris: & doctrina astrorum sparsam esse. Hanc sententiam
hoc uenustissimo reddidit disticho ~~quodammodo~~
~~quodammodo~~

Etsi enim suspicientem in caelum, stellasq; contemplantem fateri necesse est: esse
Deum aliquem sapientissimum & potentissimum: à quo haec pulcherrima mundi Ma-
china orta sit & conseruetur: tamen, cum scientia beneficio caelum magis introspi-
cere discamus, & certissima nobis atq; aeterna motuum leges ac uices aperiantur
atq; monstrantur: fieri non potest, quin & assensio de Deo & prouidentia in ani-
mis multò firmior euadat, & erga ipsum maior pietas excitetur inflammeturq;.
Cum igitur huic doctrinae caelestium & lucidissimorum corporum Tabulae Cla-
rissimi Mathematici Iohannis de Regiomonte plurimum lucis addant, usumq;
eius abundè patefaciant: gratum Deo. laborem esse, ipsumq; laude quoq; affectum iri
existimaui: Si eas tabulas nostrae opera, cum praesertim à multis diu multumq; de-
deratas esse scirem, studiosis Astrologiae iterum communicare non grauatè stude-
rem. Nam ad hunc suscipiendum laborem non solum Typographi quidam alijque
exterarum Academiarum degentes: sed etiam nostrae huius Academiae studiosi &
conciues plurimi authores mihi & monitores fuerunt. Quocirca tum & huius labo-
rem Deo probari & laudi futurum, ac studiosos Astrorum non posse huius tabulis
carere, aut sine his parum fructus capere intellexissem: facile passus sum sibi persuas-
deri, ut eas tabulas denuo excudendas susciperem. Atqui, ut hac in re melius meam
operam praestare possem, rogavi M. Samuellem Isenmengerum Prettanum: huic
enim demandata est harum artium initia tradendi & explicandi prouincia in no-
stra Academia: ut me in adendis tabulis nonnihil iuuaret. Et inferiori autem
se multo, quàm ut in doctissimi Mathematici tabulis magna scientia & diligentia
constructis aliquid uel emendare uel mutare posset, ingenuè profitebatur: tamen
cum saepius ei meis precibus obstreperem, dedit consilium paulo concinnius & pulch-
rius orationis contextum disponendi: in eoq; quaedam emendata, quae à suis praecep-
toribus obseruata & indicata se habere affirmabat, libenter mecum communicauit.
Cum igitur, optimi Astronomiae candidati, tabulas Regiomontani elegantiores

3
Et correctiores multò, quàm antea, opera nostra, quàm libenter uobis nauauimus, in
lucem iterum prodeant: oro atq; obsecro uos, ut eam, qualiscunq; sit, æquo animo in-
terpretemini Et consulatis.

Deum æternum patrem Domini nostri Iesu Christi precor: ut in hac rerum
omnium perturbatione aliqua Ecclesiæ suæ et scholis hospicia, quibus cum alia mul-
ta tum etiam horrendi astrorum congressus Et positus deinceps ruinam plurimasq;
calamitates minari uidentur, præbere uelit: in quibus Et cœlestis de filio ipsius
doctrina propagari latè, hæc de cœlestium corporũ motu et efficacia scientia con-
seruari Et ad posteros transmitti possint. Bene Et feliciter Valete. Tu-
bingæ. Anno à Christo nato 1558. à condito mundo 5520. sub
occasum matutinum Humeri dextri Orionis.

TOXITES LECTORI.

Quas iterum tabulas Isenmengerus adornat,
Mons peperit longè Regius ante tibi.
Non opus hoc ætas, preclaris inuida rebus,
Consumet: genio uiuet ubiq; suo.
Laudes ergo pijs meruere laboribus ambo,
Non alia hoc etenim præmia tempus habet.

IOANNES SECCERVITIVS.

Qui cupis in patriam celsos attollere uultus,
Syderaq; ingenio nunc habitare tuo:
Huc ades, & sacri per Regia culmina montis,
Certa tuæ recolas hæc monimenta uiaë.
Inuida quæ solito ne crimine delet ætas,
Procedunt titidis nunc renouata notis.
Scilicet extingui Regum miracula Memphis
Viderit, & moles Roma perire suas.
Hæc tamen à sæuis, auro potiora, ruinis
Munera posteritas asseruisse uelis.

Quæ

7
Quæ qui parua putat, Mundiç in carcere cæco

Oblita terrena lumina sece gerit:

Ille suas equidem stellas miretur in arca,

Et putet hic magni signa nitere poli,

Nos quæ prima uocat pietas, quæ numen in astris.

Curaçq; cœlestes proxima monstrat opes.

Arte iuuet superos iam nunc penetrare recessus,

Regnaçq; mox æquo nostra futura Deo.

Omne fœlici quæ mens ut præmia tangat

Alig er his tabulis Dædalus esse potes.

S A. I S. B.

Tempus edax rabida quamuis metat omnia falce,

Mors quoçq; sit saxis, marmoribusçq; sua:

Non tamen hoc decus infringet ruinosa senecta

Ingenij, quod mons Regius ille dedit.

Nam uirtus nunquam, non mens bene docta latebit

Sed pia succedet, non peritura polo.

GEORGIUS OSTERMARIUS.

Cum sprætæ iaceant animis uulgaribus artes,

Cognita quæ certis legibus astra colunt:

Non tamen in tanto rerum discrimine uirtus

Inclyta supremos est habitura rogos.

Si quid at in studijs uigiles meruere labores:

Hæc quoçq; (crede mihi) pagina perpes erit.

Quæ tibi, quisquis ades, studio disposta fideli,

Ingenio magnas diuite promet opes.

Quare age sæpe legas hunc grata mente libellum,

Quem manet ingenio non periturus honor.

Vt tibi fertilibus ceu uinea culta racemis,

Vbere cum fructu commoda magna ferat.

* 3

REVERENDISSIMO IN CHRISTO
Patri & domino, domino Ioanni Archiepiscopo Strigonia
ensi, Legato &c. Ioannes Germanus de Regio
monte se humiliter com=
mendat.

Magnam esse admodum & fuisse semper in ædendis libris diffi-
cultatem mihi uideri solet, dum reuoluo maiorum nostrorum
exemplaria: ac præsertim eorum exordia conspicio, ubi plæriq;
tenuitatem ingeniorum suorum insimulant, non suffecturam ui-
delicet coepto operi. Alij uero arduitate tentati negotij penè de-
terri uidentur, nonnulli ferratis suis ueuiam datum iri uolunt,
dubiam scribendi fortunam haud iniuria suspicantes. Mihi autem reuerendis-
sime Domine aliud præterea accedit, quod factum prorsus impossibile reor: assi-
duæ scilicet iussioni tuæ morem gerere, ac demum iudicio tuo non minus acuto
quàm recto dignum aliquid reddere. Tuæ profecto monitioni nefas est contra-
uenire: qui enim licentius in me habeat imperium, præter te mortalis nemo est.
Vbi autem lucubrationes meas coram te iam rigido quàm perspicacissimo cen-
sore depromsero, labascet illico animus. Quis enim eruditissimus licet aliquid
nouarum literarum impunè tibi afferet? quippe qui omni doctrina ac uirtute
mirum in modum præditus es, diuinarum humanarumq; rerum plenam tenes
cognitionem: omnibus cuiuscunq; literaturæ cum te præbeas auditorem, omnes
tamen excellentissima eruditione tua antecellis adeò, ut discipulos sese fateantur,
quicunq; in habitu præceptorum ad te accesserint. Quantus es quàm profundus
in sacris existas literis: neminem ignorare arbitror. Quid referam de iure ponti-
ficio? cuius notitia quidem ornamento tibi est, usus autem dignitati tuæ perne-
cessarius, quippe qui supra omnes Prælatos regni Hungariæ primatum tenes:
uniuersa demum philosophia tibi familiaris est, disciplinæ autem quadruuales
decus & gloriam pepererunt. Quòd si ad negotia humana transeundi detur li-
centia, quis non admirabitur immensam tuam prudentiam, ex qua totius regni
Hungariæ gubernatio pendet: ita tamen foris publica curas, ut domi quoq; ma-
gnificentia tua ineffabilis demonstretur: in arce inquam Strigoniensi, ad cuius re-
stitutionem assiduam etsi nullis parcas impensis, longè tamen ampliori sumptu
solertioriq; studio bibliothecas præciosissimas, ac omni genere codicum referis-
simas instituisti. Quantam præterea & quàm perennem curam habeas condendi
studij generalis, conclamatum esse iam pridem arbitror, cum ex uniuersis litera-
torum consortijs omnium professionum doctissimos quosq; uiros accersere so-
leas, officio fretus regni Cællarij supremi, cui coepto felicissimo me quoq; VVi-
ennensis

ennensis collegij alumnus quantumcunque adesse uoluisti, docturum uidelicet
quadruuales facultates. Venienti igitur, uoluntatiq; tuæ morem gesturo mihi
in primis id mandati dedisti, ut tabulas quasdam directionum componerem,
quæ & usu faciles & iudicibus utiles essent. Rectè quidem animaduertisti diffi-
cultatem huiusce rei, quam profectò omnes Astrologi tanquam horrendum sco-
pulum declinant: nemo omnium est qui sese tantis rebus satis expedire possit,
tametsi multifaria huius negotij præcepta passim reperiantur. Hali nempe in
quarto libro suo artem directionum asserit esse complementum iudicij natalis:
quamobrem operæ præcium decreuit, compilare tabulas soluendi nodos: quæ
cum nostra tempestate nusquam reperiretur, Parmensis quidam Archidiaconus
auctorem secutus, tales contexit ad medium sexti climatis, imbecilles tamen, ac
à mente Ptolemæi eiusq; Commentatoris, imò & ab opinione propria (quòd foæ-
dissimum est) longè alienas. Nam & ipse modum dirigendi per sphaeram solidã,
officio semicirculi Meridiano & Horizonti coeuntis summopere laudat, & Pto-
lemæum idem (quod uerum est) sensisse arbitratur. Postremo tamen in tabulis
suis ponit fiduciam, ignorans utiq; quantum his duobus modis interesse possit
discriminis, quòd reuera 5. gradus (absurdum dictu) nonnunquam excedit. Erit
forsitan qui Ptolemæum clarissimum eiusdem quoq; uitæ insimulabit, quippe
qui in tertio quadripartiti sui agens de spacio uitæ, paulò antequam ad duos di-
rigendi modos descendit, totius artis iacit fundamentum, necessarium quidem
ratus in directione sequentis loci positionem similem fieri positioni antecedentis,
id autem nequaquam accidere, nisi locus sequens traducatur ad semicirculum, in
quo statuebatur locus antecedens, quòd & Hali expositor eius confirmat. Ve-
rum duo modi eius cum exemplis à computatione directoria, qua memoratus
Parmensis, ac penè omnes alij utuntur, non discrepant. Quid igitur de tam pru-
denti quàm eruditissimo uiro sentiemus? Nunquid tantum philosophum repug-
nantes asseruisse sententia s impunè suspicabimur? Credo equidem Ptolemæum
& serio tradidisse fundamentum artis per semicirculos huiusmodi, & modum
numerandi apprimè calluisse, quamuis difficilem, adeò ut perplexum potius red-
deret auditorem quàm doctum. Satius ergo putans prope uerum uersari, quàm
ueritatem ipsam radicius quærendo desperare, supputationes quasdam breues
ueritati propinquas exposuit. Quòd haud quaquam mirum uideri debet, cum et
nostra ætate Ragusinus ille Ioannes Gazulus tametsi Ptolemæi eruditissimi,
Gebuq; acutissimi, ac aliorum plurimorum doctrinas acceperit, nullam tamen
prorsus numerandi facilitatem in directionibus ac æquandis domibus aduexit,
quinimo turbam maximam multitudine argumentationum concitauit. Quan-
tum itaq; difficultatis in hoc existit negotio, satis liquet. Quid autem commodi
nanciscemur, si generalis quædam artis directoriæ promptitudo nobis illata fue-
rit. ex libris Iudicum abundè colligeretur, ubi tempora futurorum accidentium
omnium per directiones potissimum inuestigari solent. Tantam igitur utilitatem
præsul dignissime directionū tabulæ afferent, quas petebas in quacunque regione
latitans

latitudinem 60. graduum non excedente, siue significator dirigendus in itinere
solari existat, siue ab eo uersus alteram polorum secedat, in quibus maximam
Solis ab Aequatore suppositi declinationem trium & uiginti graduum cum di-
midio, obseruationibus modernis maiorem non admittentibus. In omni demum
regione duodecim coeli domicilia constituere, ac in eis stellas distribuere, aliasque
plurimas scitu iucundissima per hasce tabulas addiscere licebit. Eas itaque primicias
operum meorum suscipere digneris, quas ubi pro acumine ingenij
tui probaueris, in publicum prodire iubeto.

Vale praesulum decus.

PRIMUM PROBLEMA

Declinationem planetæ, habentis cognitum locum in Zodiaco, inuenire breuiter.

reperita fuerit.

Være signum & gradum loci planetæ in latere dextro tabulæ declinationum, si fuerit in medietate Zodiaci ascendente, uel in sinistro, si in medietate descendente extiterit: latitudinem autem si quam habet, in latere superiori transuerso, & in angulo communi offendes declinationem Planetæ quæsitam, septentrionalem quidem, si supra scalam rubram, meridianam autem si infra eam

Quod si longitudo planetæ, uel latitudo eius, aut utraq; non fuerit expressa in lateribus tabulæ, agendum est duplici introitu, ut assolet, hoc pacto.

Intrabis primo cum longitudine & latitudine proximo minoribus, & angulum communem extra notabis, eum deniq; angulum communem conferas ad numerum immediate sequentem, inferiorem uidelicet, si longitudo planetæ in latere sinistro tabulæ accepta fuerit, aut superiorem si in latere dextro: & de differentia horum numerorum accipies partem proportionalem secundum proportionem minorum, iuxta gradus integros longitudinis existentium ad 60. minuta, addendam quidem angulo communi, si numerus sequens ipso angulo communi maior fuerit, minuendam autem si minor: quam partem proportionalem seruabis seorsum, cum nota additionis uel minutionis, uti res ipsa postulat.

Deinde pariformiter conferes angulum communem memoratum ad numerum ei collateralem, uersus sinistram quidem, si latitudo septentrionalis fuerit, uersus dextram autem, si meridiana, et de differentia anguli communis numeriq; collateralis accipies partem proportionalem, secundum proportionem minorum latitudinis ad 60. addendam item ut prius, si numerus collateralis angulo communi maior fuerit, minuendam uero, si minor.

Has itaq; duas partes proportionales coniunges, si uel ambæ fuerint addendæ, uel ambæ minuendæ, cogeriemq; earum angulo communi adijcies si addendæ fuerint, aut ab eo demes si minuendæ extiterint, collectus enim numerus aut relictus declinationem quæsitam manifestabit.

Si uero altera quidem memoratarum partium proportionalium addenda fuerit, altera autem minuenda, fuerintq; ipsæ æquales, angulus communis intactus pro declinatione planetæ habebitur.

Si autem inæquales extiterint, differentia earum addetur angulo communi, si maior pars proportionalis addenda erat, aut minuetur ex eo, si maior minuenda fuerat, & quod colligetur hoc pacto uel relinquetur declinationem planetæ computabit: septentrionalem quidem, ut prius, si supra scalam rubram steterit angulus communis, meridianam autem si infra.

Contingit autem nonnunquam scalam rubeam intercipere angulum communem & numerum immediate sequentem, tunc itaq; angulus communis iungendus est numero immediate sequenti, tunc itaq; angulus communis iungendus

a est

De declinatione
rubra

De scala
rubra.

est numero immediatè sequenti, & cum aggregato agendum est pro parte proportionali elicienda, ut iam pridem cum differentia anguli communis numerice sequentis.

Verum si postremo non posset fieri subtractio ab angulo communi, fiat è contrà, subtrahendo uidelicet angulum communem ab ipsa parte proportionali, & relinquetur declinatio quæ sita, alterius tamen denominationis, quàm erat angulus communis.

Et si planeta nullam habuerit latitudinem, intrabimus præfatam tabulã cum uero loco planetæ, & ex directo eius in columnula mediã, supra quam nullus scribitur numerus latitudinis, habebimus declinationem quæ sitam.

Similiter agemus planeta latitudinem habente in minutis duntaxat, hoc uno tamen adiecto, quòd declinatio in angulo communi occurrens conferatur ad numerũ ei collateralem: sinistrum quidem, si latitudo septentrionalis fuerit, dextrum autem si meridiana: & de differentia numerorum accipiatur pars proportionalis, quemadmodum superius monitum est.

Quamuis autem de planetis solum hucusq; sermo sit habitus, potest tamen hæc tabula stellis etiam fixis accommodari, illis uidelicet, quæ latitudinem 8. graduum ab itinere solari haud quaquam egrediuntur.

In exemplo facilius forsitan accipies. Habeat planeta quispiam gradus 12. minuta 15. Virginis, cum latitudine septentrionali graduum 3. & minutorum 24. Inuestigaturus igitur declinationem eius ab Aequatore, uideo gradus 12. Virginis, in latere sinistro tabulæ, 3. autem gradus latitudinis in fronte eiusdem tabulæ, sub quibus descendo usq; aduersum 12. graduum Virginis, ubi offendo numerum anguli communis graduum 9. minutorum 51. cuius quidem anguli communis & numeri immediatè subsequenti differentia est 23. minuta, de quibus accipio partem proportionalem secundum proportionem minutorum 15. longitudinis ad 60. quartam scilicet partem, quæ est ferè 6. minuta: Hæc autem pars proportionalis minuenda est, quòd numerus subsequens angulum communem minor eo fuerit.

Similiter confero angulum communem ad numerum ei collateralem uersus sinistram, cui latitudo planetæ septentrionalis subiecta est, & de differentia quæ est 55. minuta accipio partem proportionalem secundum proportionem 24. minutorum latitudinis ad 60. illa pars proportionalis est 22. minuta, addenda uidelicet, quòd numerus collateralis angulo communi maior occurrit. Dempta itaq; parte proportionali lōgitudinis ex parte proportionali latitudinis, manent minuta 16. quæ adiungo angulo communi, & eadẽ inuenio declinationem planetæ septentrionalem 10. graduum et 7. minutorum. Reliquas autem uarietates operationũ cum & faciles sint, & ex iam nunc memoratis edisci possint, ingenio tuo relinquendas censuimus, ne dicacitati potius quàm utilitati studuisse uideamur.

S E C U N D U M P R O B L E M A.

Cuiuslibet stelle fixæ uel planetæ declinationem generaliter computare.

Ex præcedenti didicimus, quo pacto cuiusvis stellæ latitudinem g. graduum non egredientis declinatio inuestigatur: cum aut plurimæ stellæ fixæ multo latius euagentur, quarum influxus tum propter corporum magnitudinem, tum propter earum ad alias siue fixas siue erraticas colligantiam uel commixtionem summopere animaduertendus est, siquidem stellæ fixæ (Ptolemæi *S. Starum fixarum effectus.* testimonio) dant dona grandia, quàmuis sæpenumero infauste finiant, decreuimus generalem declinationum computationem tradere, quo cautius atq; abundantius genituras iudicaturi, accidentia futura præuidere possint.

Intrabis igitur tabulam declinationis generalem cum longitudine stellæ, accipiendo uidelicet gradum longitudinis in latere tabulæ sinistro, si nomen signi in fronte tabulæ repertum fuerit, in latere autem dextro, si in calce tabulæ nomen signi offenderis, & numerum ex directo eius gradus occurrentem (qui inscribitur arcus) seorsum notabis cum denominatione sua, septentrionali uidelicet, si signum longitudinis stellæ fuerit septentrionale, meridiana aut si meridianum: Est aut arcus huiusmodi portio circuli latitudinis per stellam incedentis inter Aequatorem & iter solare comprehensus: Notabis etiam numerum multiplicandum gradui stellæ obiectum.

Deinde latitudinem stellæ iunges arcui seruato, si eandem cum ipso arcu denominationem habuerit, eritq; aggregatum eiusdem denominationis cum amobus, aut alterum ex altero deme, latitudinem scilicet ex arcu memorato, aut arcum ipsum ex latitudine, si diuersarum fuerint denominationum, residuum autem eam sortietur denominationem, quam habebat id à quo facta est subtractio.

Tale itaq; aggregatum uel residuum si quod fuerit, erit arcus circuli latitudinis stellæ, inter Aequatorem et uerum locum stellæ contentus. Nam si nullum esset huiusmodi residuum, quod accidit, dum latitudo stellæ & arcus circuli latitudinis inter Aequatorem & eclipticam æquales quidem, sed diuersarum existunt denominationum, nullam prorsus ab Aequatore declinationem stella ipsa pateretur.

Per sinum igitur rectum arcus iam nunc memorati multiplicabis numerum multiplicandum superius seruatum, & producto, quinque primas figuras uersus dextram reijcies, unitate relictis adiuncta, si reiectæ figuræ plus 5000. denotauerint. Hoc enim pacto sinum rectum declinationis stellæ cognosces, cuius arcum tabula sinus exemplo suscitabit, qui quidem arcus erit declinatio stellæ quæ sita, eademq; sortietur denominationem, quam habebat supra dictum aggregatum uel residuum. *Quando stella nullam habeat declinationem.*

Quod autem paulo remissius præcepisse uideamur, si quando iuxta gradus loci stellæ minuta quæpiam iacuerint, prohibentia introitum tabulæ ad integros gradus factæ, hoc unum generaliter iubemus. agendum esse duplici introitu ubi opus fuerit, quemadmodum in præcedenti monuimus, ac in alijs tabularum operibus fieri solet: quod qui non prius didicerit: quàm hæc aggreditur tabulas, ineptus doctrinæ nostræ censebitur auditor. Iam proposito nostro breue accommodabitur exemplum. Stella quæuis in fine sit 12. graduum Virginis, habens latitudinem borealem trium graduum. Computaturo igitur mihi declinationem eius occurrit nomen signi in calce tabulæ, quã obrem accipio duodecim gradus in latere dextro *Exemplum.*

tabulae, in quorum uersu supra nomen signi offendo arcum septentrionalem septem graduum & 39. minutorum, numerumque multiplicandum 92528. arcui iam dicto addo 3. gradus latitudinis stellae, resultat arcus 10. graduum & 39. minutorum, cuius sinus rectum, scilicet 11089. duco in 92528. producuntur 1026042992. a quibus reijcio primas quinque figuras uersus dextram, & relinquuntur 10260. sinus scilicet rectus declinationis quaesitae, cuius arcum tabula sinus supponens semidiametrum circuli 60000. particularum reddit 9. graduum & 51. minutorum.

TERTIVM PROBLEMA.

Cuiuscunque planetæ ascensionem rectam faciliter numerare.

INtra tabulam coeli mediationis cum uero loco planetæ ac latitudine eius siquam habet, & in angulo communi uidebis ascensionem rectam ab initio Arietis computandam.

Si tamen longitudinem planetæ, uel latitudinem eius, aut utramque non inuenis, precise in lateribus tabulae ingredi cum numeris proximo minoribus, & numerum anguli communis seorsum nota.

Deinde subtrahe dictum numerum anguli communis a numero immediate ei subiecto, accommodatis 360. gradibus si opus fuerit, & de differentia eorum accipe partem proportionalem secundum proportionem minutorum, quæ sunt iuxta gradus longitudinis ad 60. minuta.

Huiusmodi autem pars proportionalis semper est addenda in hoc negotio, scribe ergo eam seorsum cum nota additionis, similiter compara angulum communem ad numerum dextro lateri eius uel sinistro, uti processus latitudinis exigit, adiacentem, & minore eorum dempto ex maiore, de differentia accipio partem proportionalem secundum proportionem minutorum, iuxta gradus latitudinis existentium ad 60. minuta, quæ pars proportionalis addenda quidem erit quando numerus collateralis angulo communi maior existit, minuenda uero quando minor.

Si itaque ambæ partes proportionales addendæ fuerint, collige eas, & congeriem angulo communi adijcias.

Si autem ambæ minuendæ aggregatum earum ex angulo communi minuas.

Quod si altera quidem earum addenda fuerit, altera autem minuenda, differentiam earum adde angulo communi, si maior pars proportionalis fuerit addenda, aut minue si maior minuenda fuit. Quod enim hac lege uel colligetur uel residuabitur, ascensionem planetæ rectam numerabit.

In huiusmodi autem operatione nonnunquam colliguntur plures quam 360. gradus, tunc itaque 360. abijciendi sunt, & residuum pro ascensione recta tenendum.

Stellæ autem latitudine penitus carentis ascensionem rectam inuenies uel in columnula media, cui figura 0. supra scribitur, uel per tabulam ascensionum rectorum, quemadmodum communiter fieri solet.

Præterea

Præterea contemplandum est quod in principio tabulæ sub latitudine septentrionali, & in fine eiusdem sub latitudine meridiana contingit aliquando numerum anguli communis esse maiorem 356. gradibus, & numerum collateralem, dextrum inquam uel sinistrum, minorem 4. gradibus, aut è contra, tunc itaq; minori earum adiungendus est totus circulus 360. graduum, & aggregato utendum est, ac si fuisset repertum in tabula pro parte proportionali, ac cæteris operibus absoluendis.

Quicquid autem hætenus de planetis præcepimus de stellis quoq; fixis accipiendum est, latitudinem 8. graduum nequaquam exilientibus.

In exemplo reperatur stella qua usi sumus in primo problemate ex directo 12. graduum, sub latitudine trium graduum septentrionali inuenio gradus 164. minuta 34. cuius numeri & proximo subsequenti differentia est 56. minuta, de qua differentia accipio partem proportionalem secundum proportionem 15. minutorum ad 60. minuta, est autem pars illa proportionalis 14. minutorum addenda, item dictus numerus anguli communis demptus ex numero collateralis sinistro relinquit 24. minuta, quorum pars proportionalis secundum proportionem 24. minutorum ad 60. est fere 10. minuta addenda: congregatis itaq; huiusmodi partibus proportionalibus, & congerie earum adiecta ipsi angulo communi, resultabunt 164. gradus & 58. minuta: tantam igitur pronuntiabo ascensionem rectam stellæ propositæ.

Q V A R T V M P R O B L E M A.

Ascensionem rectam cuiusuis stellæ generaliter inuestigare.

INtra tabulam cœli mediationum generalem, cum uero loco longitudinis stellæ & arcum Aequatoris ex directo eius repertum seorsum scribe cum numero multiplicando, arcum inquam qui inscribitur radix ascensionum. Est autem arcus huiusmodi portio Aequatoris inter principium Arietis & circumlum latitudinis stellæ comprehensa.

Deinde cum declinatione stellæ ingredi tabellam fœcundam, & numerum ibidem repertum duc in numerum multiplicandum iam pridem seruatum, & productocq; primas quinque figuras uersus dextram abijce, nam residuus numerus solus, aut cum unitate si abiectæ figuræ plus 50000. significauerint, erit sinus rectus cuiusdam arcus Aequatoris intercepti à circulo latitudinis & circulo declinationis per uerum locum stellæ transeuntibus.

Quære itaq; arcum eius per tabulam sinus (eum arcum, qui à plerisque uocatur differentia transitus stellæ per cœli medium) quem adde radici ascensionum, si uerus locus stellæ fuerit in medietate eclipticæ descendenti, quæ uidelicet à capite Cancrî incipit, & ad initium Capricornî per Libram incedendo desinit, & stella ipsa habuerit declinationem septentrionalem, aut si stella fuerit in medietate ascendenti cum declinatione meridiana.

Si fuerit in medietate descendenti cum declinatione meridiana, aut in medietate

te ascendenti cum septentrionali declinatione, minue prædictum arcum a radice ascensionum, quod enim hoc pacto eueniet, uel addendo uel minuendo, prout res ipsa postulat, erit numerus ascensionis rectæ computandus in Aequatore ab initio Arietis.

Quòd si nõ potuerit fieri subtractio differentia, transitus per coeli medium ab ipsa radice ascensionum adiungendus est integer circulus 360. graduum memoratae radici, ut ab aggregato possit fieri subtractio.

Si præterea stella nullam habuerit declinationem, radicem ascensionum pro ascensione recta stellæ tenebis.

Hoc demum non est silentio prætereundum, quòd cum quilibet sinus rectus minor sinu quadrantis duos habeat arcus, unum scilicet minorem quadrante, alterum autem maiorem eo, tunc quidem accipiendus est arcus minor quadrante, quando arcus circuli latitudinis per stellam transeuntis, qui inter Aequatorem & uerum locum stellæ comprehenditur, minor quadrante circulum existit, tunc autem maior, dum ille quadrantem superabit.

Exemplū.

Verbi gratia repeto stellam, cui in secundo problemate tribui 12. gradus Virginis cum tribus gradibus septentrionalis latitudinis. Intransi itaq; mihi tabulam coeli mediationum generalem cum 12. gradibus Virginis, obicitur radix ascensionū habens 160. gradus et 29. minuta, numerusq; multiplicandus 24590. huic stellæ in secundo problemate computata est declinatio septentrionalis 9. graduum & 51. minutorum, quibus mediantribus per tabellam foecundam duplici introitu inuenio multiplicatorem 17363. eum duco in 24590. procreantur 426956170. à quibus reijcio primas 5. figuras, uice earum tamen addendo unitatem relicto numero quinquidem excedunt 50000. sic habeo 4270. sinum rectum differentia transitus per coeli medium, cuius arcus est 4. gradus & 5. minuta, quem adiungo radici ascensionum, & resultat ascensio recta quaesita 164. graduum & 34. minutorum.

Q V I N T V M P R O B L E M A.

Ex ascensione recta cognita arcum eclipticæ sibi coascendentem indagare.

Quære numerum ascensionis rectæ in corpore tabulæ ascensionum reclarum, & ex directo eius in fronte quidem signi Zodiaci, in latere autem dextro uel sinistro numerum graduum eiusdem signi habebis.

Si autem ascensionem rectam propositam non inueneris precise in arca tabulæ memoratae, accipe duas ascensiones rectas in tabula expressas, quarum altera quidem proximo minor extat ascensione proposita, altera autem immediate maior, & minor earum ex maiore dempta, numerum reliquum appellabis primum, qui quidem est portio uni gradui eclipticæ debita.

Deinde prædictam ascensionem minorem subtrahe ab ascensione recta proposita, & residuum pro numero secundo teneo. Tertius autem numerus semper erit 60. minuta. Duc itaq; secundum in tertium, & productum diuide per primum, quod

quod namq; huiusmodi diuisione partum fuerit, de minutis adñciendum erit, numero graduum eclipticæ ex directo ascensionis rectæ minoris inuento, & colligetur numerus graduum ac minorum quos habet arcus eclipticæ quæsitus.

Sic uerbi gratia ascensio recta data 97. gradus & 54. minuta, quam non inuenio precisè in arca tabulæ ascensionum rectarum; sed proximo ea minor est 97. gradus & 38. minuta, proximo autem maior 98. gradus & 43. minuta, harum ascensionum differentia est unus gradus & 5. minuta, id est 65. minuta. Per resolutionem ecce primus numerus, minor deniq; dictarum ascensionum subtracta ex ascensione recta proposita relinquit 16. minuta, secundum scilicet numerum, tertius autem numerus erit 60. minuta, duco igitur secundum in tertium, producantur 960. secunda, quæ diuisa per primum numerum scilicet 65. minuta, eliciuntur 15. ferè minuta addenda 7. gradibus Cancrì.

Exemplum.

SEXTVM PROBLEMA.

Punctum eclipticæ cum quo stella quæuis cœlum mediat perscrutari.

Huiusmodi punctum eclipticæ non potest facilius ac breuius inueniri quàm per ascensionem rectam ipsius stellæ, quò certè præmittendum erat, qua lege talem ascensionem rectam computare liceret. Nam ipsa ascensio recta sæpenumero utilis est & permaxime in directione significatoris cuiuscunq;, tametsi punctum, cum quo significator talis cœlum mediat, ignoretur. Vnde seorsum docere libuit computationem ascensionum rectarum, ne quis directurus significatorem quempiam arbitretur opus esse inuentione puncti, cum quo significator huiusmodi cœlum mediat.

Ad rem igitur redeuntes posteaquàm ex altero duorum antecedentium documentorum, tertio scilicet uel quarto, didicimus ascensionem rectam stellæ propositæ, quæremus eam in tabula ascensionum rectarum ab Ariete incipientium, & ex directo eius in capite quidem tabulæ signum, in latere autem gradum eiusdem signi, cum quo stella talis mediat cœlum duplici etiam introitu si opus fuerit offendemus. Talis enim ascensio recta communis est stellæ propositæ, & gradui uel puncto eclipticæ, cum quo ipsa mediat cœlum.

Huius autem problematis exemplum si desideras, ad præcedens refugientum est problema.

SEPTIMVM PROBLEMA.

Arcui eclipticæ quantocunq; in omni regione, cuius latitudo 60 gradus non excedit, ascensionem obliquam per computum certum deputare.

Cognita latitudine regionis ad quam operare instituis, aut eleuatione poli supra Horizontem quemcunq; uoles, intra tabulam ascensionum obliquarum ei subiectam cum signo & gradu finali arcus propositi, & in angulo communi habebis ascensionem obliquam respondentem arcui eclipticæ proposito, computandam quidem a sectione uernali, si arcus eclipticæ datus ab eadem sectione sumpserit initium.

Si uero aliunde arcum quempiam eclipticæ inchoaueris, quære primo ascensionem obliquam principio eius debitam, secundum modum iam nunc traditum, deinceps pariformiter ascensionem obliquam fini eius attinentem addisceas. Subtracta enim ascensione obliqua principij ab ascensione obliqua finis eius, accommodato integro circulo si opus fuerit, relinquetur ascensio obliqua arcus propositi.

Memento tamen agendum esse duplici introitu, ut assolet, si quæ ultra gradus integros minuta fuerint in arcu eclipticæ proposito.

Si deniq; eleuatio poli minuta quædam habuerit, operare primo per eleuationem poli, proximo minorem secundum modum iam expositum.

Deinde per latitudinem proximo maiorem, & inuenta duplici ascensione obliqua ad eundem arcum eclipticæ minorem deme ex maiore, relicta namq; differentia respondebit uni gradui eleuationis poli, de qua accipe partem proportionalem secundum proportionem minorum ultra gradus integros eleuationis poli existentium ad 60.

Hanc itaq; partem proportionalem adde ascensioni obliquæ primæ, si ipsa minor extiterit ascensione obliqua secunda, aut ab ea minue si ipsa prima superauerit secundam. Nam quod alter horum modorum eueniet, ascensionem obliquam numerabit quam quærebas. In exemplo facilius accipies.

Exemplū.

Habeat arcus quidam eclipticæ 12. gradus & 15. minuta Virginis, uolo inuenire ascensionem eius obliquam in regione, cui polus eleuatur 47. gradibus & 45. minutis.

Intro cum 12. gradibus Virginis tabulam 47. graduum, & inuenio 155. gradus & 46. minuta, quos deme ex 157. gradibus & 7. minutis, quæ respondent 13. gradibus Virginis in eadem tabula 47. graduum: de differentia autem relicta, quæ est unus gradus & 21. minuta, accipio partem proportionalem secundum proportionem 15. minorum ad 60. hæc pars proportionalis est 20. minuta ferè addenda primæ ascensioni obliquæ.

Item eandem ascensionem primam confero ad 155. gradus & 29. minuta, quos reperio iuxta 12. gradus Virginis in tabula 48. graduum, & de differentia quæ est 17. accipio partem proportionalem secundum proportionem 45. minorum eleuationis poli ad 60. minuta, pars illa proportionalis est 13. minuta ferè subtrahenda ab ascensione obliqua primæ.

Habeo itaq; duas partes proportionales, quarum altera quidem est addenda primæ ascensioni obliquæ, altera autem minuenda ex ea: quamobrem deme minorem earum ex maiore, & relinquuntur 7. minuta, quæ adiecta sæpe memoratae ascensioni primæ conflant ascensionem obliquam quæsitam 155. graduum & 53. minorum.

OCTAVVM PROBLEMA.

Descensionem obliquam cuiuscunq; arcus eclipticæ dimetiri.

Si

4

S I arcus eclipticæ propositus ab Ariete sumpserit initium, addè ei semicirculum, & aggregati arcus eclipticæ ascensionem obliquam ex præcedenti addiscas, dempto enim semicirculo ex iam memorata ascensione obliqua relinquetur descensio obliqua arcus propositi à sectione uernali computanda.

Sed arcu eclipticæ proposito aliunde sumente initium, quære ex præcedenti ascensionem obliquam arcus ei diametraliter oppositi. Nam tanta quoque erit descensio obliqua arcus propositi. Arcus autem diametraliter oppositos appello eos, quorum principia inuicem & fines diametraliter opponuntur.

Descensio uero recta arcus quancumque in Horizonte uidelicet recto æqualis est, imò eadem ascensionem rectæ eiusdem arcus, quam obrem non erat opus seorsum tradere, quo pacto talis ascensio recta computaretur.

Exempli gratia uolo numerare descensionem obliquam ad finem 12. gradus Virginis in regione habente latitudinem 48. graduum: addo arcui eclipticæ proposito semicirculum, & perducor ad 12. gradus Piscium, quorum ascensio obliqua est 351. gradus & 21. minuta, ex qua ascensione dempto semicirculo scilicet 180. gradus, & relictos 171. gradus cum 21. minutis pronuntiabo descensionem obliquam arcus propositi.

Exemplum.

Sed si libeat inuenire descensionem totius signi Virginis, accipio arcum ei diametraliter oppositum, scilicet totum signum Piscium, cuius principium quidem habet ascensionem obliquam 345. graduum & 10. minutorum, finis autem est 360. demptis igitur illis ex istis relinquuntur mihi 14. gradus & 50. minuta, & tanta erit descensio obliqua signi Virginis.

NONVM PROBLEMA.

Quantus arcus eclipticæ debeat cuicumque ascensionem uel descensionem obliquam perscrutari.

Mitte numerum ascensionis obliquæ in tabulam ascensionum obliquarum, eam uidelicet, cui latitudo regionis uel eleuatio poli data supra scribatur, & ex directo ipsius in summitate quidem tabulæ offendes signum Zodiaci, in latere autem numerum graduum eiusdem signi qui debentur ascensionem obliquam propositæ, quemadmodum in quinto problemate circa ascensiones restas monuimus.

Si tamen eleuationem poli septentrionalis nusquam inueneris precise, quod accidit minutis quolibet iuxta gradus existentibus, operare primo per tabulam latitudinis proximo minoris secundum uiam iam nunc monstratam.

Deinde similiter per tabulam latitudinis proximo maioris, & de differentia arcuum eclipticæ inde elictorum sume partem proportionalem secundum proportionem minutorum quæ adiacent gradibus integris propositæ eleuationis poli, ad quam partem proportionalem adde arcui eclipticæ per tabulam minoris eleuationis computato, si ipse minor fuerit arcu eclipticæ per tabulam maioris

ris.

ris elevationis reperto, aut ab eo minue si maior eo fuerit: & quod uel addendo colligetur, uel minuendo relinquatur, prout res ipsa postulat, numerabit arcum eclipticæ quæsitum.

Sed quantus arcus respondeat descensionis propositæ, sic scies, ipsi descensionis datæ semicirculum id est 180. gradus adde, & aggregato tanquam ascensionis obliquæ arcum eclipticæ computa secundum modum iam nunc traditum, à quo arcu eclipticæ semicirculum, uidelicet 180. gradus aut sex signa communia, minue, quod enim relinquatur erit arcus eclipticæ quem petebas.

Hæc autem documenta tenent, ascensione uel descensione obliqua à sectione uernali initium sumente.

Nam si aliunde inciperet, inuenienda essent modo prædicto duo puncta eclipticæ, quorum alterum quidem principio, alterum autem fini talis ascensionis uel descensionis obliquæ responderet. Arcus enim eclipticæ duobus talibus punctis interceptus esset qui quærebatur. Is quidem modus erit exactæ computationis.

Nam si celerius ac propè uerum agere decreueris, licebit uti tabula ascensionum obliquarum, cuius inscriptio aut titulus uicinior erit latitudini regionis, uel elevationi poli ad quem uolebas operari.

Nunc quo facilius ante dicta intelligantur, exemplaris computatio subiicienda est: uerum quando iuxta gradus elevationis poli non sunt minuta aliqua, operatio omnino similis erit ei quam in quinto problemate exposuimus.

Exemplū.

Sit itaq; eleuatio poli 47. graduum & 45. minutorum, ascensio autem obliqua proposita 70. graduum & 36. minutorum procedendo secundum modum quinti problematis inuenio 7. gradus & 26. ferme minuta Cancrī ad eleuationem poli 47. graduum: similiter ad eleuationem poli 48. graduum reperio 8. gradus & 21. minuta Cancrī.

Horum duorum arcuum eclipticæ differentia est 55. minuta, de quibus pars proportionalis secundum proportionem 45. minutorum ad 60. est 41. minuta ferè quæ adiecta arcui eclipticæ ad 47. gradus reperto, conflant 8. gradus & 7. minuta Cancrī, arcum scilicet eclipticæ quæsitum pro ascensione demū obliqua.

Breue exemplum accipe: offertur mihi descensio obliqua 97. graduum & 34. minutorum, cui correspondentem arcum eclipticæ iubeor inuestigare ad eleuationem poli 48. graduum. Adiungo memoratæ descensionis 180. gradus, & resultant 277. gradus & 34. minuta, hunc arcum tanquam ascensionem obliquam offendo in tabula 48. graduum iuxta 12. gradus Sagittarij, reiectisque 6. signis communibus perducor ad 12. gradus Geminorum, qui uidelicet respondent oblatae descensionis.

DECIMUM PROBLEMA.

Ascensionem obliquam stellæ cuiuscunq; in Horizonte quolibet dinumerare.

Vsus tabule differē-

Hic nostro proposito seruiet tabula differentiarum ascensionalium, dum stella non pluribus quam 32. gradibus ab Aequatore remouetur.

In

In latere enim sinistro dictæ tabulæ utriusque partis tã borealis quã australis *tiarum de*
declinatio usque ad 32. gradus ponitur, quòd nullus planetarum, quorum gratia *scensiona-*
potissimum tabulam ipsam condidimus, tantam declinationem egredi soleat. *lium.*

In latere autem superiori transuerso ponuntur eleuationes poli septentriona-
lis, supra Horizontes regionum ac circulos positionum usque ad 60. gradus.

Arca autem tabulæ differentias ascensionum complectitur.

Elevationem igitur poli quære in fronte tabulæ memoratæ, declinationem
autem stellæ siue borealem siue australem in latere sinistro. Nam quod in angulo
communi offendes, erit differentia ascensionum stellæ propositæ, quam demas
ex ascensione recta stellæ superius inuenta, si declinatio stellæ borealis fuerit, aut
eidem adijcias si australis extiterit. Sic enim uel relinquetur uel colligetur ascen-
sio obliqua stellæ quam quærebas ad Horizontem propositum.

Quòd si stellæ fixæ ampliorem quã 32. graduum declinationem habentis
ascensionem obliquam computare libeat, intrabis tabellam fecundam cum ele-
uatione poli supra Horizontem datum, & numerum ex directo eius occurren-
tem seruabis.

Similiter in eadem tabella accipies numerum cum declinatione stellæ ad quam-
cunque partem fuerit, horum numerorum alter alterum multiplicet, et productum
per 6. extendatur, reiectisque primis sex figuris uersus dextram, unitatem relictis
iungendo, si reiectæ plus 500000. denotauerint, relinquetur sinus rectus differ-
entiæ ascensionum stellæ propositæ, cuius sinus arcum docebit tabula sinum
maximum habens 60000. particularum.

Cognita itaque differentia ascensionum uteris ad ascensionem obliquam stellæ
sciendam, quemadmodum iam pridem monuimus. Facilius tamen idem efficies,
si tabula tua maximum sinum habeat 100000. Nam altero duorum numerorum
per eleuationem poli ac declinationem stellæ inuentorum in alterum multiplica-
to, a producto abijcies quinque figuras primas uersus dextram, unitate relictis ad-
iuncta, si abiectæ plus 50000. representauerint, & reliqui sinus recti arcum ex
tabula memorata elicies, qui erit differentia ascensionum proposito tuo condu-
cibilis.

Hic tamen animaduertendum, quòd quando differentia ascensionum ab ipsa
ascensione recta subtrahi nequit, adijciendus est integer circulus 360. graduum,
& ab aggregato minuenda est differentia ascensionum præfata.

Similiter quando differentia ascensionum adiecta ascensioni rectæ numerum
maiolem 360. gradibus coaceruauerit, ipsi 360. gradus reijciendi sunt, relictis
uidelicet pro ascensione obliqua computatis.

In exemplo reperatur stella secundi problematis, quæ habuit declinatio- *Exempli.*
nem septentrionalem 9. graduum & 51. minutorum: uolo inuenire ascensio-
nem eius obliquam in Horizonte, cui polus eleuatur 48. gradibus, per tabu-
lam igitur differentiarum ascensionalium sub eleuatione poli 48. graduum cum
declinatione

declinatione 9. graduum & 51. minutorum duplici introitu inuenio differentiam ascensionum 11. graduum & 7. minutorum, quam demo ex ascensione recta stellæ inuenta per tertium aut quartum problema, quæ 164. gradus, & 34. minuta, sic enim relinquatur ascensio obliqua 153. graduum & 27. minutorum.

Secundum uiam autem uniuersalem sic procedo.

In tabella fecunda iuxta numerum eleuationis poli 48. graduum inuenio numerum 111062. quem seruo ad partem.

Item per eandem tabellam cum declinatione stellæ duplici introitu elicio alium numerum 16364. quem duco in prius seruatam numerum, producuntur 728480568. ille numerus per senariū multiplicatus reddit hunc 11570883408 abiectis autem primis sex figuris, adiecta quoque unitate, ut assolet, remanet mihi sinus differentię ascensionum 11571. cuius arcus est 11. gradus & 7. minuta, cum quo tandem, ut prius, ascensio obliqua reperitur. Tabellam autem sæpe dictam non iniuria fecundam appellare libuit, quod multifariam ac mirandam utilitatem instar fecundæ arboris parere soleat.

V N D E C I M V M P R O B L E M A.

Descensionem obliquam stellæ cuiuscunq; numerare.

Inuenta differentia ascensionum stellæ propositæ ex præcedenti documento, adde eam ascensioni rectæ ipsius stellæ declinationem septentrionalem habentis, uel minue huiusmodi differentiam ascensionum ab ea, si declinatio stellæ fuerit meridiana. Nam quod colligetur aut residuabitur, erit descensio obliqua stellæ propositæ.

Hic non est opus exemplo aliquo speciali, cum differentia ascensionum, quæ prius addita est, pro ascensione obliqua habenda, hic subtrahitur pro descensione obliqua, & e contra quæ ibi subtrahitur, hic additur.

D V O D E C I M V M P R O B L E M A.

Arcum semidiurnum Solis uel alterius stellæ cuiuscunq; cognoscere.

Inuenias modo prædicto 10. problematis differentiam ascensionum stellæ, quæ est etiam dimidia differentia diei æquinoctialis & diei inæqualis stellæ, eam igitur 90. gradibus adiunge, si stella declinationem septentrionalem habuerit, aut eam ex 90. gradibus minue pro stella declinationem habente meridiana.

Sic enim uel conflabis uel residuabis arcum semidiurnum stellæ propositæ, quo demum ex 180. gradibus dempto, relinquetur arcus seminocturnus. Et item arcu semidiurno duplato arcus diurnus, & seminocturno geminato nocturnus prodibit arcus.

Quorum utrumuis si per quindenos quidem gradus partiaris numerus horarum æqualium ei respondentium profiliet, per duodenas autem particulas si secueris, quantitas horæ inæqualis uel temporalis emerget.

Idem quoque efficeret per differentiam ascensionum, aut dimidiam dierum differentiam, Nam si eam per 15. diuiseris, & numerum quotiens senario addideris

Differentia ascensionalis quid sit.

addideris pro septentrionali declinatione. aut ex ea dempseris pro meridiana, habebis numerum horarum æqualium temporis semidiurni, cuius duplum horas totius diei numerabit.

Si denique eandem differentiam ascensionum per senarium distribuieris, & numero nascenti 15. adieceris pro septentrionali declinatione, aut ex 15. dempseris pro meridiana, resultabit quantitas horæ inæqualis.

Verum arcus diurnus Solis alia lege computari poterit, subtractis enim ascensionibus obliquis loco Solis uero respondentibus ab ascensionibus obliquis puncto ei diametraliter opposito pertinentibus, relinquetur arcus diurnus solaris. Idem quoque modus obseruabitur de quocunque puncto eclipticæ, tametsi Sol in eo non fuerit.

Quod si habueris tabulam ascensionum rectorum apud Capricornum incipientium, subtrahe ascensionem obliquam, cuius puncto eclipticæ debitam ab ascensione eius recta, & relinquetur arcus semidiurnus eiusdem puncti.

Repeto exempli causa stellam cuius differentia ascensionalis est 11. gradus et 7 minuta, quemadmodum in decimo problemate ostensum est. quæ uocari solet etiam dimidia differentia diei æquinoctialis, & diei inæqualis: quare cum arcus semidiurnus æquinoctialis sit 90. graduum, & declinatio stellæ sit septentrionalis, addo eam 90. gradibus, & resultant 101. gradus cum 7. minutis. Tantusque habetur arcus semidiurnus stellæ propositæ.

Quæ deinceps minuo ex 180. gradibus, & remanet arcus seminocturnus 78. graduum ac 53. minutorum. Item duplato arcum semidiurnum eueniunt 202. gradus & 14. minuta pro arcu diurno.

Similiter duplato arcum seminocturnum resultant 157. gradus cum 46. minutis, arcus scilicet nocturnus.

Deinde arcum diurnum diuido per 15. & exeunt 13. horæ æquales cum 29. minutis horæ, accipiendo uidelicet uice uniuscuiusque gradus relictæ post diuisionem 4. minuta, & pro singulis 15. minutis gradus unum minutum horæ.

Præterea diuido arcum diurnum per 12. & exeunt 16. gradus cum 51. minutis. Residuum enim facta diuisione per 60. multiplicauit, & producto addidi minuta 14. collectumque totum iterum per 12. diuisi, ascendunt igitur 16. gradus & 51. minuta in una hora temporalis uel inæquali. Cetera omnia sunt facilinæ computationis.

T R E D E C I M V M P R O B L E M A.

Punctum eclipticæ, cum quo stella quæuis uel oritur uel occidit, inquirere.

Inuenta ascensione obliqua stellæ propositæ per 10. problema, quære arcum eclipticæ ei respondentem per 9. Punctus enim terminalis eiusdem arcus eclipticæ oriri solet cum stella proposita.

Non aliter elicies punctum cum quo occidit, si prius didiceris quantus arcus eclipticæ descensionis eius obliquæ tribuatur.

Est & alius modus inueniendi punctum cum quo stella occidit.

Si

Alium mo-
dus inueni-
endi pun-
ctum cum
quo stella
occidit.
Obiectio.
Solutio.
Directio.
Vfus Ascē-
sionum.

Si enim ascensioni obliquæ ipsius stellæ arcum diurnum eius adieceris, prodiebit ascensio obliqua puncti orientis dum stella occidit. Eo igitur puncto per 9. problema cognito, punctus quoque diametraliter ei oppositus haud quaquam latebit, cum quo uidelicet stellam propositam oportet occidere.

Exemplo autem nullo opus est in præsentiarum: si nonum & decimum & undecimum problema satis didicisti.

Sed mirabitur forte quispiam, quod tam diu computandis ascensionibus & descensionibus immoratus sim, quando quidem directiones præcipuè tractare instituerim: nemini profecto iniquum uideri debet illud, si quidem absque noticia ascensionum ac descensionum directiones absolui nequeunt, imo directio non est aliud nisi arcus quidam Aequatoris coascendens uel condescendens, cuiuspiam arcui eclipticæ, aut alij interuallo duorum locorum cognitorum, ueluti inferius exemplabitur. Quicumque igitur in dirigendis significatoribus expeditus esse uolet, in computu ascensionum ac descensionum prius apprime exerceatur necesse est. Nunc ad negotium æquandarum domorum defendere libet, ea namque res doctrinam directionum antecedere debet, cum significatores nonnunquam ad cuspides domorum, aut ipsæ cuspides ad alia loca dirigi solent.

DECIMUM QVARTVM PROBLEMA.

Initia duodecim domorum cœli rationabiliter constituere.

Priusquam ad propositum absoluendum uenietur paulo altius ordiendum est, ne præcepta nostra inania ac fundamento carentia quispiam suspicetur. Tres æquandarum domorum accepimus modos, quorum primus & uersitatissimus arcum semidiurnum puncti eclipticæ orientalis, aut arcum Aequatoris ei similem in tres æquas secat portiones, & arcum seminocturnum eius in totidem, per puncta quoque diuidentia et punctum eclipticæ orientale, ac polum mundi utrumque fingit quinque circulos magnos, qui cum Meridiano totum Zodiacum & totum cœlum in 12. partes diuidunt, quas uocant domos.

Hæc domorum distinctio quam fluxa & fragilis sit (pace uulgarium Astro-
nomorum dixerim) ex problematibus, quæ super almagesto Ptolemæi conscripsimus, aperte quiuis intelliget. Nam ut ex multis pauca decerpantur, spacia domorum hac lege distinctarum magnitudines certas ac firmas seruare nequeunt, quas profecto seruandas esse confiteberis, si circa influxus aut proprietates huiusmodi domorum recte philosophari libeat. Oriente quippe Cancro in regione, diem longissimum 16. horarum habente, 11. domus, uerbi gratia, spatium tenet duplum ei quod habet talis domus undecima ascendente Capricorno. In regione autem, cuius dies maximus 18. horas æquales complectitur, huiusmodi spacia 11. domus in proportione tripla reperiuntur. Cui ergo persuadebitur usquam, eundem esse influxum tam diuersis quam inæqualibus cœli partibus: siue cœlum quiescens posueris, unde uirtutes 12. domiciliorum deriuentur, siue propter uariam cœli ad faciem terræ habitudinem proprietates domorum distinxeris, etiam

1. modus æ-
quandarum
domorum
cœlestium.

etiam domos ipsas ab Horizonte truncari necesse erit, alteris quidem earum partibus supra Horizontem, alteris autem sub Horizonte manentibus, quod sententiæ unanimi priscorum philosophorum contraire liquet, asserentium sex quidem domos totas supra Horizontem, sex autem sub eo constitui. Præterea stellam aliquam iam dudum ortam in domo prima imprudens sistet Astronomus, stellam denique longè ab Horizonte occidentali sursum remotam sextæ domui turpiter intrudet, quæ res quantam & quàm horrendam iudicibus fallaciam ingerant, facile quisque persentiet.

Aliter autem Campano domos distinguere libuit, per circulos uidelicet quatuor magnos Horizonti & Meridiano coincidentes in utraq; earum communi sectione. Nam super altera huiusmodi sectionum tanquam polo circulum magnum descriptum intelligit per uerticem capitis aut regionis transeuntem, huiusmodi quadrantes Meridiano & Horizonte interceptos in trinas æquales secari portiones imaginatur, & per puncta sectionum duci quatuor memoratos circulos, qui una cum Meridiano & Horizonte circulum uerticalem ante dictum, itemque eclipticam ac totum insuper cœlum in duodena partiuntur intervalia, fitque hac distinctione, ut quæuis dicta 12. spacia cœli siue corporalia intellexeris, siue superficialia, æquales inuicem magnitudines fortiantur: eclipticæ tamen 12 partes inæquales semper reperiuntur, præterquam dum poli eclipticæ cum duabus Horizontis & Meridiani sectionibus concurrunt, quod accidit in regione cuius latitudo maximæ Solis declinationi æquatur. Modus tamen ille quàm alienus sit à mentibus antiquorum & quàm futilis, quòd circulo uerticali imaginario ac nihili uirtutis habenti innititur, silentio prætereundum censemus: ne paulo licentius euagari uideamur, cum & maxime pleniorum huius negotij absolutionem aliunde expectandam esse iusserimus.

Tertius modus habet medium inter duos memoratos, utroque scilicet eorum participans, diuidit enim quatuor quadrantes Aequatoris Meridiano & Horizonte obliquo interceptos in trinas æquales portiones, & per puncta sectionum ducit quatuor circulos magnos Meridiano ac Horizonti concurrentes in duabus eorum sectionibus: tales itaque sex circuli, assumptis scilicet Meridiano & Horizonte, totum cœlum in 12. spacia partiuntur, quæ nuncupantur domus. Hæ autem domus etsi inæquales inuicem sint in omni Horizonte obliquo, tamen suam quæque seruat magnitudinem inuariabilem. Sic sectiones quidem in Aequatore sumuntur uti in primo modo non in circulo uerticali, concursus autem circa locum domus distinguendum fit in sectionibus communibus Meridiani & Horizontis, ueluti in secundo modo non in polis mundi. Hæc uia media secure ac rationabiliter gradiemur, ubi incommoditates duobus modis extremis obijci solitas haud quaquam formidabimus, uerum munimenta huiusmodi uia cum multa sint, & absque nimis longa digressionem narrari nequeant, missa facimus in præsentiarum, ne disputare potius uideamur, quàm tabularum nostrarum usum explanare, quod profecto principaliter intendimus.

Hæsitanti

Hæsitanti autem quocumq; circa traditiones nostras liber secundus problematum almagesti perlegendus est, ubi & fundamenta tabularum nostrarum, & rationes æquandarum domorum ac dirigendorum significatorum, cum plerisque rebus alijs iudicio astrologico conducibilibus abunde exposuimus.

Quomodo
figuræ cœ-
li erigendæ
sint ratio-
nabiliter.

Nunc ad rem ipsam redeuntes docebimus, quo pacto in omni habitatione, cuius latitudo 60. gradus non excedit initia 12. domorum cœli cognoscenda sint.

Intra igitur tabellam domorum rationabilem cum latitudine regionis tuæ aut elevatione poli borealis, & duos numeros ex directo eius occurrentes diligenter serua seorsum, quorum primus quidem inscribitur numerus polaris 11. & tertiæ, nonæ ac quintæ domorum, secundus autem 12. & secundæ, octauæ ac sextæ. Ille autem numerus polaris notificat arcum circuli magni, qui à polo boreali circulo domum quamuis determinanti ad rectos incidit angulos, deinde uideas cui tabulæ ascensionum obliquarum supra scribitur numerus polaris undecimæ domus, nam ea semper uteris in tua regione ad principia 11. & tertiæ domorum inuenienda.

Similiter explorandum est, quæ tabulæ ascensionum obliquarum supra scriptum habeat numerum polarem 12. & secundæ, nam illa semper præbebit initia 12. & secundæ domorum.

Hoc pacto ascensionibus rectis loco Solis respondentibus adde gradus Aequatoris à meridie exortos, qui per horas æquales distantie Solis à meridie cognoscuntur, unicuiq; uidelicet, horæ 15. gradus tribuendo, & colligetur ascensio recta mediæ cœli, unde & per quintum problema medium cœli scietur.

Deinde ascensionem rectam mediæ cœli 30. gradus adijcias, & congeries talis erit ascensio obliqua principii 11. domus debita: per tabulam itaq; 11. domus, cui uidelicet numerus polaris 11. domus supra scribitur, inuenies arcum eclipticæ dictæ ascensionem obliquam respondentem. Finis enim huius arcus erit initium 11. domus.

Item eidem ascensionem obliquam 11. domus iunge 30. gradus, & aggregatum erit ascensio obliqua pertinet ad principium 12. domus. Per tabulam igitur 12. domus quære arcum eclipticæ debitum, & habebis initium 12. domus.

Amplius memoratæ ascensionem obliquam 12. domus adijcias 30. gradus, & colliges ascensionem obliquam ascendentis: Ex tabula ergo regionis tuæ per 9. problema gradum ascendentem & initium primæ domus addisces.

Postea ascensionem obliquam ascendentis 30. gradus appone, & habebis ascensionem obliquam principii secundæ domus: unde & per tabulam suam modo sæpe dicto initium secundæ domus non latebit.

Similiter ascensionem obliquam secundæ domus 30. gradibus adiectis resultabit ascensio obliqua tertiæ domus, ac demum per tabulam suam principio ipsius domus cognoscenda uia parabitur.

In summa sic accipies, ex ascensione recta mediæ cœli per additionem continuam trigenorum graduum nasci solent ascensiones obliquæ reliquarum quinque domorum

domorum per tabulas eis accommodatas suscitatae.

Postquam autem sex domorum capita memoratarum cognoueris, initia reliquarum quoque sex domorum haud quaquam latebunt, cum suam quaeque comparem per diametrum circuli aspiciat.

Exemplum huic documento subiungendum est, habeat Sol 6. gradus Tauri, *Exemplum.* distans à meridie per tres horas & 14. minuta, uolo inuenire principia 12. domorum coeli ad latitudinem 48. graduum.

In tabella igitur domorum rationabili iuxta 48. gradus latitudinis inuenio numerum polarem 11. & tertiae domorum 29. graduum & 2. minutorum, numerum autem polarem 12. & secundae 43. graduum & 53. minutorum.

Hos numeros seruo seorsum, deinde per tertium problema inuenio ascensionem Solis rectam 33. graduum & 40. minutorum, pro unaquaque autem hora distantiae à meridie accipio 15. gradus Aequatoris, & pro quaternis minutis horae unum gradum, uti fieri solet, sicque arcum 48. graduum & 30. minutorum colligo, distantiam uidelicet solis à Meridiano, quam addo ascensioni Solis rectae, ut emergat ascensio recta medi coeli 82. graduum & 10. minutorum, & ipsum coeli medium 22. gradus cum 49. minutis Geminorum, cui demum ascensionem rectae addo 30. gradus, & resultat ascensio obliqua respondens principio 11. domus 112. graduum & 10. minutorum, huic quoque ascensionem obliquae 11. domus addo 30. gradus, & prouenit ascensio obliqua 12. domus 142. graduum & 10. minutorum.

Similiter per additionem continuam trigenorum graduum efficio ascensiones obliquas ad initia reliquarum domorum. Primae quidem, cuius initium est gradus ascendens 172. gradus & 10. minuta, secundae autem 202. gradus & 10. minuta, tertiae uero 232. gradus & 10. minuta.

Deinde intro tabulam ascensionum obliquarum 29. gradibus elevationis positi subiectam, cum ascensionibus, obliquis 11, & tertiae domorum, & per documentum noni problematis inuenio unum gradum cum 28. minutis Leonis pro 11. domo: pro tertia autem 15. gradus & 14. minuta Scorpionis.

Similiter cum ascensionibus obliquis 12. & secundae domorum intro tabulam 44. gradibus suppositam, & eodem modo reperio unum gradum & 4. minuta Virginis pro 12. domo: pro secunda autem 17. gradus & unum minutum Librae.

Non aliter cum ascensionibus obliquis ascendentis, uel primae domus per tabulam regionis uidelicet 48. gradibus subscriptam elicio 24. gradus & 14. minuta Virginis pro ascendente.

Sic inuenta initia sex domorum à medio coeli incipientium, reliquarum autem domorum principia per diametrum praedictis opponuntur: quare & ipsa haud quaquam latebunt. Vfus autem sum 29. gradibus uice 29. graduum & 2. minutorum, similiter 44. gradibus uice 43. graduum & 53. minutorum, propter uicinitatem numerorum, cum tabulae ascensionum obliquarum ad integros gradus

b sint

sint factæ, hoc etenim pacto nihil erroris sensibilis ingeritur.

Si tamen curiose magis quam utiliter omnia ad ungem exhaurire libet, nonnum problema consulendum est. Iste est modus generalis æquandarum domorum ad omnem poli eleuationem, quamuis nonnihil difficultatis in opere uideatur habere.

Quamobrem si celeriozem computationem desideras, fac tabulam domorum regionis tuæ propriam, secundum modum iam traditum, incipiendo uidelicet à medio cœli uel ascendente, commodius tamen est initium à medio sumere cœli.

Q. V I N D E C I M V M P R O B L E M A.

Duodecim domos cœli per circulos magnos in utroq; polo mundi coeuntes ad quamuis latitudinem 60. gradus non excedentem determinare.

Etsi modum hunc ualde usitatum negligere iam pridem decreuerim, tamen hoc in loco docere libuit, quo pacto secundum eum quoq; domus æquandæ sint uniuersaliter in quacunq; regione, latitudinem 60. graduum non egrediente: quò abundius siue utilitas, siue amplitudo tabularum præsentium demonstretur.

Modus operationis Ascensioni igitur rectæ mediæ cœli si à sectione uernali inceperit iunge 90. gradus, & resultabit ascensio obliqua ascendentis, qua mediante gradus ascendens per tabulam regionis tuæ documento noni problematis innotescet.

Deinde arcum semidiurnum ascendentis per 12. problema cognoscas, quem diuide in tres partes æquales, eritq; unaquæq; illarum partium dupla ad quantitatem horæ temporalis diurnæ ipsius ascendentis.

Tale autem duplum si dempseris ex gradibus 60. relinquetur duplum horæ inæqualis nocturnæ ascendentis, qualiter tuncq; autem huiusmodi duplum horæ inæqualis reperies, nihil refert.

Illud ergo duplum adde ascensioni rectæ mediæ cœli, & resultabit ascensio recta principio 11. domui respondens, quæ per quintum problema arcum eclipticæ suum, atq; idcirco initium 11. domus eliciet.

Item ascensioni rectæ 11. domus adde prædictum duplum horæ inæqualis: sic enim ascensionem rectam principio 12. domus debitam conflabis, unde & ipsa domus initium sortietur notum.

Amplius ascensioni rectæ 12. domus prædictum duplum adde, & eueniet ascensio recta ascendentis, cui horæ nocturnæ adiunge duplum ipsius ascendentis, & colligetur ascensio recta initij secundæ domus, cui insuper si idem duplum adieceris, ascensio recta principio tertiæ domui seruitura prodibit.

Ex his autem ascensionibus rectis si puncta eclipticæ eis respondentia nescires elicere, inertiam tuam turpiter proderes, præsertim cum operatio hæc sit uulgaris admodum, & ante hac in quinto problemate sufficienter exposita.

Habitis autem initijs sex domorum à medio cœli incipientium, reliquarum quoq; initia diametraliter uidelicet iam memoratis opposita non latebunt.

Si

Si tamen exemplaris computatio placet, ponatur in medio cœli 12. gradus Exemplum
Tauri: uolo æquare domos secundum hunc modum. Ascensio recta huiusmodi plum.
medij cœli est 39. gradus & 33. minuta, quibus adiungo 90. gradus, resultant
129. gradus 33. minuta, ascensio scilicet obliqua ascendens: & ideo ascendens
ipsum 23. gradus & 5. minuta Leonis.

Huius ascendens arcus semidiurnus per prius exposita est 105. gradus et 53
minuta, quem diuido in tres æquales portiones, quarum quæcque habebit 35. gra-
dus cum 18. minutis ferè, & tantum erit duplum horæ diurnæ ascendens.

Hoc duplum demo ex 60. & relinquuntur 24. gradus cum 42. minutis: du-
plum igitur horæ diurnæ addo ascensionem rectæ medij cœli, quæ erat 39. gradus
33. minuta, resultat ascensio recta 11. domus 74. graduum & 51. minutorum.

Cui demum adhiçio idem duplum, & emergit ascensio recta 12. domus 110.
graduum & 9. minutorum.

Huic quoque addo idem duplum ut nascatur ascensio recta ascendens 145.
graduum & 26. minutorum, omitto autem unum minutum, quia duplum horæ
diurnæ defecit parumper in secundis à 35. gradibus & 18. minutis.

Item dictæ ascensionem rectæ ascendens adiungo duplum horæ nocturnæ,
sicque colligo ascensionem rectam secundæ domus 170. graduum & 8. minuto-
rum: huic denique aggregato super adiungo prædictum duplum horæ nocturnæ,
& resultat ascensio recta tertiæ domui tribuenda 194. graduum cum 50. minutis.

Per illas ascensiones dirigente quinto problemate inuenio pro undecima 16.
gradus & 4. minuta Geminorum, pro duodecima 18. gradus & 36. minuta
Cancris, pro secunda 19. gradus cum 15. minutis Virginis, pro tertia autem 16.
gradus cum 8. minutis Libræ.

Sic cuspides sex domorum orientalium inuentæ sunt: unde & reliquarum sex
occidentalium initia propter diametralem oppositionem innotescunt.

SEDECIMUM PROBLEMA.

*Initia duodecim domorum cœli secundum reliquum modum extremum in regione
qualibet latitudinem 60. graduum non extendente, breuiter constituere.*

Huius uiaæ æquandarum domorū Campanus quidem speculationem expo-
posuit, uerū quo pacto executioni numeratoriæ mandaretur, silentio præ-
terit: quod profectò uel imbecillitatē huius uiaæ, uel difficultatem arguit
executionis. Si enim Campanus stabilem arbitratus est hunc modum, quid eum
arcere potuit, quo minus artificialē eius usum traderet, nisi ipsa negotij difficul-
tas: aut si calculum eius in promptu habuit, idcirco non ædidisse uidetur, quod
huiuscemodi domorum distinctionem infirmā esse animaduertit: posset tamen
subtiliter potius quam utiliter ita imaginari. Ioannes aut Ragusinus sola penè
auctoritate Campani suffultus eum modum censuit prosequendum: nam cæte-
rorum astronomorū testimonia, quæ sibi usuuenire arbitretur (pace eius dixerim)

b 2 non

non pro sua sed nostra sententia militant, & quidem apertissime, quod alibi latius differemus. Is igitur postquam opinionem Campani sectari decreuit, documentum ædidi æquandarum domorum, idoneum quidem proposito suo ac Geometricis fundamentis stabilitum, uerum prolixum ac multifarium suspicionēque plenum, adeo ut sine tædio intollerabili ne unam quidem domum quispiam in numeris etiam exercitatissimus elaboraret, quod & Gazulus ille apertè confiteatur in quarta parte operis sui circa principium. Sex etenim multiplicationibus sinuum per sinus, & item sex diuisionibus ad cuspidem unius domus inueniendam opus est cum plerisque additionibus ac subtractionibus & cautelis multiplicibus. Quamuis itaque huiusmodi domorum distinctio rationabiliter fundata esset, nondum tamen facultatem computandi nacti essemus, quam in presentiarum explanare decreuimus: non tanquam utilem futuram astrologo, uerum potius demonstraturam tabularum nostrarum amplitudinem.

1 modus
computandi.

Intra igitur tabellam domorum secundum Campanum & Gazulum cum elevatione poli ad tuam regionem, & ex directo eius inuenies interstitium decimæ domus cum numero polari undecimæ, itemque interstitium undecimæ cum numero polari 12. domus, hos numeros serua seorsum cum suis inscriptionibus. Appellatur autem interstitium arcus quidam Aequatoris duobus circulis domum quamuis claudentibus interceptus. Numerus uero polaris superius est definitus. Illud tamen non est ignorandum, undecimam & tertiam domum eundem habere numerum polarem, similiter duodecimam & secundam in numero polari communicare.

Quod si congeriem interstitiorum decimæ & undecimæ domorum ex 90. gradibus dempseris, interstitium 12. domus relinquetur, quod reuera est æquale interstitio primæ domus: interstitium autem secundæ domus æquatur interstitio 11.

Quando itaque libet æquare domos secundum hunc modum, inuenias prius medium cœli, ut assolet, cuius ascensioni rectæ adiungas interstitium 10. domus, & resultabit ascensio obliqua cuspidi 11. domus respondens, qua mediatrice per tabulam numero polari 11. domus subiectam agnosces punctum eclipticæ memoratæ ascensioni appropriatum, quod solent appellare cuspidem ipsius domus.

Deinde ascensioni obliquæ 11. domus iunge interstitium 11. domus, & colligatur ascensio obliqua 12. domus, cui item adiecto interstitio 12. domus ascensio obliqua primæ domus, aut ascendens prodibit, quam etiam habebis, si ascensioni rectæ mediæ cœli ab Ariete incipienti quadrantem circuli adieceris.

Si demum ascensioni obliquæ ascendens interstitium primæ domus adideris, ascensio obliqua secundæ domus colligetur: cui tandem interuallum secundæ domus adiunge, & habebis ascensionem obliquam tertie domus.

Vnaquæque autem dictarum ascensionum obliquarum per tabulam numero polari suæ domus subiectam domus ipsius cuspidem suscitabit cognitam, quem admodum pro 11. domo iam nunc monuimus.

Exemplo autem nullo opus esse reor, quoniam quidem modus iste æquandarum

rum

rum domorum negligendus est. Si tamen exercitij gratia periculum in hac re facere lubet, inuentis ascensionibus obliquis domorum quaesitarum cum numeris suis polaribus, cuspides earum non aliter quam in decimoquarto problemate docuimus, addisces.

DECIMUM SEPTIMUM PROBLEMA.

Vtrum stella quaevis aut punctus eclipticae quilibet sit in parte caeli orientali uel occidentali cognoscere.

PArtem caeli orientalem uoco eam quae incipit a medio caeli & ad angulum terrae per ascendentem eundo terminatur, medietatem uidelicet caeli quae ad meridiem insipienti a sinistris existit, reliquam autem medietatem quae a dextris est occidentalem.

Subtrahe igitur ascensionem rectam stellae propositae ab ascensione recta mediae caeli, ad instans considerationis tuae, adiecto integro circulo si opus fuerit, & relinquetur elongatio stellae a Meridiano, quae si minor fuerit semicirculo 180. graduum, stellam ipsam in medietate occidentali dices esse, si autem maior 180. gradibus in orientali; quod sit praecise 180. gradus complexa fuerit angulum terrae stella ipsa occupabit, si autem nihil fuerit residuum in medio caeli stellam esse pronuntiabis.

Exemplum breue, medium caeli habeat 22. gradus & 49. minu. Geminorum, Sol autem in fine 6. gradus Tauri reperiatur, uolo tentare propositum huius problematis de Sole. Ascensio recta mediae caeli est 82. gradus & 10. minuta, ascensio autem recta Solis 33. gradus & 40. minuta, quam minuo ex ascensione recta mediae caeli, & relinquuntur 48. gradus cum 30. minutis, scilicet elongatio Solis a meridie minor semicirculo: quare Solem esse in medietate occidentali caeli enuncio.

DECIMUM OCTAVUM PROBLEMA.

Vtrum stella sit supra terram aut sub terra faciliter coniectare.

EX antedictis arcum semidiurnum stellae ac seminocturnum addisce, deinde si stella fuerit in medietate occidentali, & elongatio ipsius a meridie minor arcu semidiurno, stella ipsa supra Horizontem constituetur.

Si autem dicta elongatio a meridie arcum semidiurnum superauerit, sub terra uersabitur proposita stella, elongatione demum a meridie & arcu semidiurno existentibus aequalibus stellam ipsam Horizon occidentalis tenebit.

At stella medietatem caeli orientalem occupante, demptis 180. gradibus ex elongatione eius a meridie, relinquetur elongatio eius ab angulo terrae, quae si minor arcu seminocturno stellae extiterit, nondum supra terram emerisse stellam dices: si autem arcum seminocturnum excefferit, supra terram proculdubio constituetur.

Quod si arcus seminocturnus elongationi ab angulo terrae aequalis extiterit, stella ipsa Horizontem orientalem possidebit. Idem aliter experieris ac multo breuius, si prius ascendentem gradum punctumque eclipticae, quo cum stella oritur, & item punctum cum quo occidere solet, recte didiceris, b 3 Hoc

a medio caeli
quae uertit
a meridie
Extrema
plum.*

Hoc enim pacto scies ultra medietatum eclipticæ supra Horizontem aut infra eum existat, et si punctum cum quo stella oritur fuerit in parte orientali, nondum tamen occiderit, scies stellam quoque nondum ortam esse: si autem punctum cum quo occidit fuerit in parte occidentali nondum tamen occiderit, scias stellam nondum quoque occidisse.

Pariformiter conicies stellam esse ortam uel occidisse, secundum habitudinem puncti eclipticæ oriri uel occidere soliti cum ipsa stella, unde tandem situm stellæ, supra terram nè fuerit, an sub terra planè intelliges.

Exempli gratia repetatur situs Solis qui in præcedenti ponebatur, coeliq; medium idem nunc subiiciatur ex duodecimo problemate ad latitudinem 48. graduum, concludo arcum semidiurnum Solis 105. graduum & 32. minutorum: erat autem elongatio Solis a meridie 48. graduum & 30. minutorum, minor scilicet arcu semidiurno; quare Solem supra tertam esse pronuncio, cætera omnia facilia sunt.

DECIMUM NONVM PROBLEMA.

Distantiam stelle à Meridiano concludere.

Quamuis elongatio & distantia à Meridiano promiscue plerumque sumantur, in præsentiarum tamen discrimen quoddam eis interiecimus, quo sermo noster articulatio ac lucidior redderetur. In hoc nempe conueniunt, quod utraq; est arcus Aequatoris conclusus inter Meridianum regionis ac circulum per polos mundi & centrum stellæ transeuntem, uerum elongatio semper à stella uersus Meridianum secundum signorum consequentiam accipitur. Distantia aut nonnunquam contra signorum sequelam in Aequatore perpendicularitur: distantia denique semper aut tota est supra Horizontem, aut tota infra eum. Elongationis autem pars altera supra Horizontem nonnunquam existit, altera autem pars sub Horizonte.

Si igitur stella supra terram existens nondum attingit Meridianum, subtrahere ascensionem rectam mediæ coeli ab ascensione recta stellæ: si autem Meridianum transierit supra terram adhuc existens, ascensionem stellæ rectam ex ascensione recta mediæ coeli deme, & relinquetur distantia stellæ à Meridiano diurna.

Non aliter computabis distantiam eius à Meridiano nocturnam si sub terra extiterit. Si enim ante Meridianum sub terra fuerit, ascensionem rectam anguli terræ ex ascensione recta stellæ minues: si autem angulum terræ transierit, è contra ascensionem rectam stellæ ex ascensione recta anguli terræ minues, relinquetur enim nocturna eius a Meridiano distantia.

Verfa demum uice si stella supra terram existens nondum attigerit Meridianum, distantiam eius a Meridiano ex ascensione sua recta demes, & relinquetur ascensio recta mediæ coeli, aut si ascensionem suam rectam huiusmodi a Meridiano distantia adieceris, stella ipsa Meridianum prætereunte, resultabit ascensio recta mediæ coeli.

Similiter ascensionem rectam anguli terræ depræhendes, si stella talis sub Horizonte depressa fuerit.

Hinc

Hinc postremo tam coeli medium quam angulum terræ per quintum problema cognoscendi dabitur facultas.

Præterea ascensio Solis recta dempta ex ascensione recta mediæ coeli, adiecto integro circulo ubi opus fuerit, relinquet elongationem Solis a meridie.

Ex qua tandem quot horæ æquales post meridiem effluxerint facile coniectabis, si prius per quindenos gradus memoratam distribuere elongationem. Hæc breuiter admodum propter sequentia perstringere fuit consilium, ne ampliandi libri potius, quam res nouas ac utiles tradendi gratia calamum uersasse uideamur, præsertim cum alibi res huiuscemodi plerisque in locis tractatæ sint, & quidem abundissime.

VIGESIMVM PROBLEMA.

Quantum eleuatur polus borealis supra circulum positionis stellæ cuiusuis, aut alicuius signati puncti in cælo inuestigare.

Huc huc arrige aures tuas quicumque totam dirigendi artem, nec non stellas in 2. coeli domicilijs sistendi artem nancisci uoles, cui negotio nonnullas tabulas exarauimus, quas tabulas positionum particulares appellare libuit: quarum unaquæque in latere suo sinistro geminam habet declinationem, septentrionalem scilicet ac Meridianam usque ad 32. gradus, tantam enim declinationem planetæ nunquam transiliunt, quorum gratia potissimum dictæ tabulæ sunt contextæ. In latere autem superiori uidelicet transversali numeros eleuationum poli supra circulos positionum ordinauimus, area uero tabulæ uniuscuiusque distantias stellarum à Meridiano comprehendit.

Circulum autem positionis appello eum, qui per duas communes sectiones Meridiani & Horizontis, aut per centrum stellæ, aut punctum coeli signatum incedit, quem etiam Horizontem stellæ nonnunquam uocari licebit. Circulus positionis.

Si igitur stella uel punctus datus supra terram existit, quære declinationem eius in latere sinistro tabulæ ad regionem tuam factæ, in parte quidem superiori si septentrionalis, in parte autem inferiori si meridiana fuerit, et inuerte eius distantiam stellæ à Meridiano, siue ante meridiana fuerit, siue post meridiana, ex directo enim iam dictæ distantie superius in capite tabulæ offendes numerum eleuationis poli quæsitum. Modus operationis

Si uero stella aut punctus propositus sub Horizõte extiterit, quære declinationem eius in parte superiori lateris sinistri, si declinatio ipsa meridiana fuerit, aut in parte inferiori si septentrionalis: in area autem tabulæ distantiam stellæ à Meridiano, & secundum modum iam nunc expositum in fronte tabulæ offeretur numerus eleuationis poli quem quærebas.

At si stella declinatione caruerit, quærenda erit similiter distantia eius à Meridiano in ultimo uersu superioris paginae, & ex directo eius in capite tabulæ inuenietur eleuatio poli quæsita.

Meminisse tamen debes operandum esse duplici introitu, quando distantia à Meridiano

b 4 Meridiano

Meridiano non integre offenditur in area tabulae, quemadmodum facere solemus per ascensionem rectam arcum eclipticae ei debitum inuestigaturi.

Si tamen huiusmodi exactam computationem paulo remissius curaueris, uice numerorum tuorum introituum accipere poteris numeros eis quam uicinissimos in tabula saltem expressos, sic enim breuissime ac sine errore notabili propositum tuum consequeris.

Huius rei gratia sit stella quaedam in fine 12. gradus Virginis habens latitudinem septentrionalem trium graduum, atque idcirco declinationem septentrionalem 9. graduum & 51. minutorum, distantia autem eius a Meridiano supra terram sit 53. graduum & 10. minutorum: uolo experiri quanta sit eleuatio poli septentrionalis supra circulum positionis eius in regione latitudinis 48. graduum, si declinatio stellae fuisset praecise 10. graduum, & distantia a Meridiano 52. grad. cum 37. minutis, inuenissem 38. gradus eleuationis poli in fronte tabulae, uerum declinatio non habet plene 10. grad. sed propinqua est 10. gradib. quare intranti mihi cum 10. gradib. partem tabulae superiorem occurrit distantia a Meridiano proximo minor proposita distantia 52. graduum et 37. minutorum, proximo autem maior 55. graduum & 2. min. differentia harum distantiarum est 2. gradus & 25. minuta, quae correspondent uni gradui eleuationis poli: hanc differentiam pono pro primo numero. Item minorem distantiam 52. grad. 37. min. subtrahio a distantia proposita 53. grad. & 10. minu. & relinquuntur 33. minuta pro secundo numero.

Tertius autem numerus semper est 60. minuta, duco igitur secundum in tertium, nascuntur 1980. secunda, quae diuido per 145. minuta aequipollentia duobus gradibus & 25. minutis exeunt fere 14. minuta, addenda 38. gradib. eleuatio itaque poli supra circulum positionis stellae est 38. graduum et 14. minutorum.

Quod si adhuc praecisius habere uolueris huiusmodi eleuationem poli eleuatione tua habente minuta iuxta gradus, intra primo cum declinatione & distantia a meridie in tabulam positionum proxime minorem, extrahendo eleuationem poli, ut iam dictum est, deinde cum declinatione eadem & distantia a meridie, in tabulam positionum proxime maiorem, & similiter elice eleuationem poli. De differentia autem harum eleuationum accipe partem proportionalem secundum proportionem minutorum existentium iuxta gradus latitudinis poli, quam adde primae eleuationi si secunda maior fuerit ea, aut minue ex ea si secunda fuerit minor. Hoc enim pacto exactius comprehendes eleuationem poli quaesitam.

VIGESIMUM PRIMUM PROBLEMA.

In qua 12. domorum coeli stella quaeuis aut punctum coeli quodlibet constituatur, explorare.

D Est stella semper intelligas aut puncto coeli declinationem 32. graduum non egrediente.

Postquam igitur ex ante memoratis initia 4. domorum angularium cognoueris, itemque puncta eclipticae cum quibus stella proposita & oritur & occidit, ac

dit, ac coelum mediat, aperte contempleris, sit ne stella in aliquo dictorum angulorum an non.

At si nullum talium angulorum obtinuerit, scies in qua quartarum coeli diuersis punctis angularibus interceptarum consistet, ut autem domus eius inueniatur, hoc accipe praeambulum.

Domus undecima & quinta, itemque nona & tertia, quamuis duobus circulis positione differentibus determinentur, polus tamen borealis aequaliter ab utroque eorum remouetur.

Similiter duodecima & sexta, item octaua & secunda per duos circulos positione diuersos cognoscuntur, uerum tamen polus borealis aequaliter supra utrumque eorum eleuatur.

Cognito itaque ex praecedenti quantum polus borealis supra circulum positionis stellae eleuatur, confer numerum huiusmodi eleuationis ad numeros polares 11. & 12. domorum per quartum decimum problema repertos, nam si fuerit aequalis numero polari 11. domus, & stella ipsa in quarta orientali diurna manserit, cuspidem undecimae necessario occupabit.

Si autem in quarta orientali subterranea fuerit, in cuspidem tertiae domus constituetur, at si numeris praedictis sese non excedentibus stella quartam occidentalem sublimem tenuerit, in principio nonae domus procul dubio reperietur.

Si uero in quarta occidentali subterranea extiterit, cuspidem quintae domus eam obtinere necesse est.

Sed si eleuatio poli supra circulum stellae positionis numerum polarem 12. domicilij aequauerit, eo ordine ac modo uti iam pridem coniectauimus stellam esse aut in principio 12. aut 2. aut 8. aut 6. domus. In principio uidelicet alicuius diuersarum domorum, quae cum stella proposita in eadem quarta collocatur.

Quod si eleuatio poli supra circulum positionis stellae non fuerit aequalis alteri duorum numerorum polarium praefatorum, certum est stellam non esse in cuspidem alicuius domorum memoratarum; unde si minor fuerit numero polari 11. domus, constabit stellam esse in 10. domo uel 9. uel 4. uel 3. prout quarta stellam ipsam tenens edocebit.

Si uero dicta eleuatio maior fuerit numero polari 11. domus, minor tamen numero polari 12. stella erit aut in 11. aut 8. aut quinta aut secunda. Si autem eleuatio poli saepe memorata excesserit numerum polarem, 12. domus, stellam ipsam aut in 12. aut 6. aut 7. aut prima, modo supra scripto, comperies.

Poteris etiam aliter experiri stellam quamuis prope cuspidem alicuius domus existentem secundum locum longitudinis suae, sit ne ante cuspidem an post eam, aut in ipsamet cuspidem, praesertim si habuerit latitudinem, quam si non haberet nulla speciali doctrina opus esset.

Nam si stella fuerit prope medium coeli aut angulum terrae, punctus coeli mediationis stellae comparatus ad medium coeli aut angulum terrae, te reddet in hac re certiolem. Si autem prope ascendentem fuerit, punctus eclipticae cum quo stella oriens solet id edocebit.

Idem

Idem faciet punctus eclipticæ cum quo stella solet occidere, si circa gradum occidentem stella extiterit.

Si autem circa cuspidem alicuius domorum orientalium inuenta fuerit, scita eleuatione poli supra Horizontem eiusdem domus, circulum dico qui determinat initium talis domus, per tertium decimum problema quære punctum eclipticæ, cum quo oritur stella proposita supra Horizontem eiusdem domus, illud enim punctum cuspidi domus collatum, stellæ situm respectu memoratæ cuspidis demonstrabit.

Non aliter argumentaberis per punctum eclipticæ cum quo stella occidit supra Horizonte alicuius domorum occidentalium, eius uidelicet iuxta cuius principium stellam tuam offenderis. Nolim o lector multitudinem uerborum absterreas, facillimam enim ipse confiteberis operationem expositam, ubi mediocri prius exercitatione fueris usus.

Exemplum.

Exemplo tamen breui tranquillioram animam tibi reddam. Stella præcedentis problematis habuit eleuationem poli supra circulum positionis suæ 38. graduum & 14. minutorum, ponatur ipsa in quarta orientali diurna, ex quartodecimo autem problemate ad latitudinem 48. graduum didici numerum polarem undecimæ domus 29. graduum & 2. minutorum, numerum autem polarem duodecimæ 43. graduum & 53. minutorum: cum iteq; eleuatio poli supra circulum positionis stellæ sit maior numero polari undecimæ domus, minor autem numero polari duodecimæ, concludo stellam esse in 11. domo. Similiter in casibus te expedies.

VIGESIMVM SECVNDVM PROBLEMA.

Vtrum due stelle utcuq; propositæ in uno circulo positionis iaceant explorare.

Coniunctio-
nes stellarum

Tribus modis stellarum coniunctiones Astronomi considerant, primum quidem secundum circulos per polos eclipticæ incedentes, quando uidelicet unus talis circulus ambas complectitur stellas.

Secundo, secundum circulos per polos mundi incedentes.

Tertio autem secundum circulos Meridiano & Horizonti in duabus eorum sectionibus coeuntes. Hoc genus coniunctionum Hali expositor quadripartiti Ptolomæi diligenter obseruare solet, quod magnam in natiuitatibus uim habeat.

Huiusmodi igitur coniunctionem in hoc proposito quærere instituimus. Sine ne uidelicet stellæ propositæ in uno tali circulo an non.

Id autem per uigesimum problema experiri nudum est.

Nam si stellis propositis una & eadem fuerit eleuatio poli borealis supra circulum positionis, coniunctas modo prædicto enuntiabimus, si uero diuersæ fuerint eleuationes poli supra circulos positionum, non erunt coniunctæ. Oportet autem ante omnia stellas ipsas in una & eadem quatuor quartarum Meridiano & Horizonte distinctarum constitutas esse.

Simili argumento utemur circa quæcunq; duo puncta coeli, quando eorum coniunctionem scire desideramus. Nullo hic exemplo opus esse reor propter facilitatem problematis.

Vigésim

VIGESIMVM TERTIVM PROBLEMA.

Oblatis duabus stellis aut duobus punctis coeli possint ne modo praedicto coniungi infra diem unum naturalem, perscrutari.

S cito primum utriusque stellae declinationem ac ascensionem rectam: deinde subtrahere ascensionem rectam unius earum ab ascensione recta alterius, & relinquetur differentia huiusmodi ascensionum rectarum, quam uocabimus interuallum aequinoctiale, id autem interuallum minus esse debet semicirculo.

Nam si maius eueniret conuersim agendum esset, minuendo uidelicet ascensionem a qua prius facta fuit subtractio, ex reliqua accommodato integro circulo si opus fuerit: si autem huiusmodi interuallum semicirculo aequale esset stellae propositae, nequaquam modo praedicto coniungi possent.

Considera demum utra stellarum prior ad Meridianum perueniat, quod per ascensiones earum rectas facile conijcies, eam etenim praecedentem appellabimus, reliquam autem sequentem.

Praeterea sciendum utra earum polo boreali uicinior existat, quod quidem ex declinationibus earum addisces. Nam si aequales & ad eandem partem Aequatoris habuerint declinationes, non erit earum coniunctio possibilis, nisi etiam simul secundum longitudinem Zodiaci coniungantur, quod genus coniunctionum in praesentiarum nobis non est curae.

His ergo sic praestitis, quare utriusque stellae declinationem in latere sinistro tabulae positionis ad regionem tuam factam, notando etiam partem declinationis utriusque, primo quidem supra terram, deinde autem sub terra, & ex directo utriusque declinationis percurre omnes numeros distantiarum a Meridiano usque ad finem tabulae. Nam si sub una & eadem eleuatione poli duas distantias a meridie inueneris, quarum differentia aequalis fuerit interuallo equinoctiali superius seruato, possibilis erit dictarum stellarum coniunctio. Item si inueneris duas huiusmodi a meridie distantias minus dicto interuallo aequinoctiali differentes, & alias duas praedictis immediatas plus eo interuallo differentes, iterum possibilitatem coniunctionis praedicabis.

Vt autem scias in qua parte coeli coniunctio talis eueniet, illud accipe argumentum. *In qua parte*
 Quando stella praecedens meridiana est sequente, & pars declinationis ac *te coe, i con*
 cepta est supra terram, memorata coniunctio erit in quarta orientali supraterra- *iunctio fit*
 nea; dum uero praecedens stella septentrionalior existit in quarta occidentali su- *at.*
 praterranea, coniunctionem euenire necesse est.

Si autem partem declinationis sub terra acceperis, & stella praecedens septentrio-
 nalis fuerit, quarta occidentalis subterranea ipsam coniunctionem habebit, parte
 ite declinationis sub terra si fueris usus, et stella praecedens meridiana extiterit,
 in quarta orientali subterranea procul dubio tali coniunctioni locus uedicabitur.

Horam praeterea memoratae coniunctionis operae precium est agnoscere.

Per distantiam igitur utriusque stellarum a Meridiano ac ascensionem eius
 rectam

rectam, ascensionem quoque rectam mediæ coeli cognosces, ex qua demum & ascensione Solis recta, decimonono problemate dirigente, horas à meridie usque ad instantans dictæ coniunctionis exactas doctè computabis.

Elevationem poli autem borealis supra circulum positionis, in qua stellas ipsas coniungi oportebit, directè supra distantias stellarum à Meridiano in fronte tabulæ offendes.

Quod si unus quidem excessus distantiarum à Meridiano minor fuerit intervallo æquinoctiali suprascripto, alter autem maior eo, atque idcirco coniunctio stellarum possibilis, uti paulo ante recitauimus, uoluerisque scire elevationem poli borealis supra circulum positionis, in quo coniungentur, subtrahere minorem excessum distantiarum à maiore excessu distantiarum à meridie, & residuum uocare numerum primum.

Deinde excessum distantiarum repertarum sub minore elevatione poli confer ad sæpe dictum intervallum æquinoctiale, differentiamque eorum pro numero secundo statue; tertius autem numerus in hoc negotio semper erit sexagenarius minorum.

Duc itaque secundum in tertium, et productum partire per primum, notata diligenter denominatione, quemadmodum in alijs similibus operationibus fieri solet, exhibit enim numerus minorum ad elevationem poli minorem addendorum.

Hoc pacto elevationem poli supra circulum positionis stellas ipsas coniungentem rationabiliter computabis.

Distantiam autem utriusque stellarum à Meridiano pro instanti talis coniunctionis hac lege scrutaberis;

Vide quantum duabus distantijs proximis alterius duarum stellarum interest, distantijs inquam, quas ante hoc contractauimus, acceptamque partem proportionalem de differentia earum secundum proportionem minorum elevationis poli nuperrime inuentorum ad 60. adicias primæ distantie à Meridiano si minorem secunda offenderis, aut ab ea minue, si maiorem.

Quicquid enim congregabitur uel relinquetur, prout res ipsa postulat, distantiam stellæ à Meridiano pro instanti coniunctionis patefaciet.

Voco autem primam distantiam à Meridiano eam, quæ sese lectori prius offert à latere sinistro tabulæ dextram uersus eunti, quæ uidelicet elevationem poli minorem supra se habet.

Exempli gratia, habeat stella quædam 2. gradus Virginis cum latitudine meridionali 3. grad. alia autem in fine quarti gradus Virginis reperiat cum latitudine septentrionali unius gradus: Sol uero 7. gradum Cancræ obtineat, uolo explorare an dictæ stellæ possint coniungi infra diem naturalem in regione habente latitudinem 48. graduum, & si coniungentur, qua hora id futurum sit.

Prima stella per primum problema habet declinationem septentrionalem 8. grad.

Secunda uero declinationem septentrionalem 11. grad. Item per tertium problema prima habet ascensionem rectam 152. grad. & 55. minorum, secunda autem 156. grad. & 16. minorum, subtrahito itaque alteram dictarum ascensionum ab altera minore

minorem scilicet à maiore, & relinquuntur 3. gradus cum 21. minutis, quos appello interuallum æquinoctiale.

Cum autem ascensio recta primæ stellæ sit minor ascensione recta secundæ stellæ, necesse est primam stellam prius peruenire ad Meridianum quàm secundam: primam ergo uocabo præcedentem, & secundam sequentem. Est autem præcedens stella meridionalior sequente, id est, minus distat à polo australi quàm secunda: cum declinatio eius septentrionalis minor sit declinatione septentrionali sequentis stellæ.

Quero itaq; declinationes dictarum stellarum in latere sinistro tabulæ positionum ad 48. gradus latitudinis, ac si stellæ sint supra terram, & ex directo earum transcurrendo binas earum à meridie distantias sub eleuatione poli 46. graduum reperio distantiam præcedentis à meridie 77. graduum & 10. minutorum, distantiam autem sequentis 80. graduum & 25. minutorum.

Harum distantiarum excessus est 3. gradus & 15. minuta, qui si fuisset gradus tres 21. minuta, iam concluderetur possibilitas coniunctionis futuræ in circulo supra quem polus eleuatur 46. gradibus: Sed quoniam dictus excessus minor est interuallo æquinoctiali, transeo ad sequentes duas distantias, quarum una scilicet stellæ præcedentis est 83. gradus & 35. minuta, alia autem stellæ sequentis est 86. gradus & 57. minuta.

Excessus harum distantiarum est 3. gradus & 22. minuta, maior uidelicet interuallo æquinoctiali: quare concludo stellas memoratas coniunctum iri.

Cum autem præcedens stella meridionalior sit stella sequente, & declinationes acceptæ sunt ac si stellæ supra terram existant, coniunctio earum erit in quarta orientali supra terram.

Vt autem instans coniunctionis mihi innotescat, prius inuenio eleuationem poli supra circulum positionis in quo coniungentur, hoc pacto.

Excessus primarum distantiarum est 3. gradus & 15. minuta, excessus autem secundarum est 3. gradus & 22. minuta, quorum differentiam scilicet 7. minuta statuo pro primo numero. Item excessum primarum distantiarum minuo ex interuallo æquinoctiali, & relinquuntur 6. minuta pro secundo numero: tertius autem semper est 60. minuta, duco secundum in tertium, producuntur 360. secunda, quæ diuido per 7. minuta, & exeunt 51. minuta fere, addenda gradibus eleuationis poli, qui ponuntur directe supra primas distantias. Sic ergo comprehendendo quòd polus borealis eleuatur 46. gradibus & 51. minutis supra circulum positionis, in quo coniunguntur memoratæ stellæ: deinde subtraho primam distantiam stellæ præcedentis à secunda eius distantia, & remanent 6. gradus cum 25. minutis, quarum pars proportionis secundum proportionem 51. minutorum ad 60. est 5. gradus 27. minuta, eam partem proportionalem addo distantie stellæ præcedentis, resultant 82. gradus & 37. minuta: tantamq; dico esse distantiam stellæ præcedentis à meridie, pro instanti coniunctionis ipsarum stellarum: quam distantiam demo ex ascensione recta stellæ præcedentis, & relinquatur ascensio recta.

recta mediꝝ coeli 70. graduum & 18. minutorum . Ascensio autem recta Solis est 97. gradus & 38. minuta, quam demo ex ascensione recta mediꝝ coeli, accommodatis 360. gradibus, & remanet elongatio Solis a meridie 332. graduum & 40. minutorum, qua diuisa per 15. exeunt 22. horæ & 11. minuta, quibus a meridie transactis talem coniunctionem fieri necesse est . Hoc autem pro corolario tenendum est, quod quælibet duæ stellæ propositæ, aut penitus non coniungentur modo prædicto, aut bis coniungentur infra diem unum naturalem: semel quidem supra terram, & semel sub terra. Vnde si cum declinationibus assumptarum stellarum ingressus fueris tabulam, ac si stellæ sint sub Horizonte, reperies, quod ipsæ coniungentur sub terra in círculo, supra quem polus eleuatur 46. gradibus & 51. minutis, quemadmodum iam pridem accidebat.

VIGESIMVM QVARTVM PROBLEMA.

Dato quocunq; ascendente in Horizonte quolibet reliquarum domorum initia artificialiter elicere.

SVperius traditum est quo pacto 12. coeli domicilia rationabiliter constituantur, sumpto exordio ab angulo mediꝝ coeli: ibi enim per additionem continuam trigenorum graduum ad ascensiones rectas mediꝝ coeli ascensiones obliquas initis reliquarum domorum respondentes, ac demum per tabulas singulis domibus appropriatas ipsarum domorum principia didicimus: hic autem dato ascendente ex tabula regionis per septimum problema ascensiones eius obliquas hauriemus, a quibus si 30. gradus reiecerimus, ascensio obliqua initio 12. domus debita relinquetur. Item ab eadem ascensione obliqua duodecimæ domus 30. gradus adiecti ascensionem obliquam undecimæ domui pertinentem relinquent, quod si adhuc 30. gradus dempseris, ascensionem rectam mediꝝ coeli residuam conspicias. Atq; trigenorum graduum additione continua super ascensiones obliquas ascendenti primæ & secundæ domorum, obliquæ ascensiones conflare solent.

Vsu huius problematis.

Superuacaneum autem uidetur denuo mouere, quo pacto præfatarum domorum principia per ascensiones suas obliquas inuestigentur, cum ante hac in quartodecimo problemate id satis explanatum sit. Quamuis itaq; memorati negotij gratia præsens problema ædidisse uideamur, tenore uerborum id persuadente, longe tamen spectabiliorem metam cursui nostro obiectare arbitrati sumus, quæ ut cognitu facilior reddatur, paulo distantius ordiendum est.

Solent egregij astrorum iudices uitam parentum ex genitura filij primogeniti, & contra diiudicare, statuendo uidelicet locum Solis quidem in natiuitate diurna filij, locum aut Saturni in nocturna tanquam ascendentem patris, itemq; locum Veneris quidem in genitura diurna, Lunæ autem locum in nocturna pro ascendente matris: hinc omnium domorum coeli eliciunt ordinem, accidentiaq; parentibus obuentura pronunciant. Non aliter faciunt pro moribus fratrum, filiorum, uxoris, amicorum ac inimicorum discernendis, ponendo uidelicet singulorum

gulorum significatores pro ascendente, quæ res quanti sit momenti uix paucis dare possemus: id ergo aliunde petendum silentio præterimus, ad coeptum negotium principale descensuri.

Cum itaq; figuram patris (uerbi gratia) erigere uolueris, & Sol (nascente filio) fuit in ascendente: non erit figura patris diuersa à figura filij.

Si autem Sol in Meridiano extiterit, adde ascensionem rectæ Solis 30. gradus, & habebis ascensionem rectam principij secundæ domus pro figura patris. Item ascensionem rectæ secundæ domus adde 30. gradus, et congregabitur ascensio recta principio tertiæ domus debita.

Similiter per additionem continuam trigenorum graduum habebis ascensiones rectas quartæ domorum, quintæ & sextæ, unde per quintum problema principia dictarum domorum, & deinde domorum oppositarum cognosces.

Sole autem in angulo occidentis constituto, cuspides domorum in figura patris non different à cuspidibus domorum filij, uerum aliud erit principium numerationis domorum: septima enim filij erit prima patris: octaua autem filij pro secunda patris accipietur, & ita de reliquis ex ordine.

Quòd si Sol in genitura filij angulum terræ occupauerit, non aliter quàm si in medio cœli esset operabimur.

Significatore autem paterno nullum dictorum angulorum tenente, eleuationem poli borealis supra circulum positionis in quo iacet significator, qui circulus Horizon etiam significatoris appellabitur, per uigesimum problema addiscas, & si fuerit dictus significator in medietate cœli orientali secundum Horizontem regionis, quære ascensionem obliquam eius in Horizonte suo per septimum problema: item numeros polares domorum ad eundem Horizontem. Quibus rebus compræhensis, per ea quæ in principio præsentis documenti exposuimus 22. cœli domos artificiose constitues.

Si autem significator patris fuerit in medietate cœli occidentali, accepta eleuatione poli supra Horizontem eius, numerisq; polaribus domorum inuentis ad eundem Horizontem: quære descensionem eius obliquam ad Horizontem suum. Deinde autem non aliter procede quàm ante hac de Sole præcepimus, quando in occidentali Horizonte filij ponebatur.

Memento tamen exposita hætenus duntaxat ueritatem tenere, quando significator huiusmodi latitudine prorsus caret.

Nam si latitudinem quantamcunq; haberet, inuenta eleuatione poli supra circulum positionis suæ, aut Horizontem suum, quære punctum cum quo oritur in eodem suo Horizonte, si fuerit in medietate orientali, aut punctum cum quo occidit in Horizonte suo, si fuerit in medietate cœli occidentali: deinde cum illis punctis eclipticæ procedas, quemadmodum antea fecisti cum significatore non habente latitudinē. In exemplo sit genitura alicuius filij primogeniti 23. horis et 29. minutis à meridie transactis secundum dies æquatos in regione habente latitudinem 48. graduum Sole existente in fine 26. gradus Cancrī: uolo constituere locum

Exemplum.

Solis

Solis pro ascendente patris & exinde totam domorum figuram elicere: Subtrahō 23. horas & 29. minuta à 24. horis, remanent 31. minuta unius horæ, quæ æquivalent 7. gradibus & 45. minutis æquatoris, aut paralleli Solis, quare dico Solem distare à Meridiano uersus orientem 7. gradibus & 45. minutis.

Declinatio autem Solis septentrionalis erit 21. graduum: cum qua & prædicta distantia Solis à Meridiano ingredior tabulam positionis ad 48. gradus latitudinis, & secundum documentum 20. problematis inuenio eleuationem poli borealis supra circulum positionis Solis 6. graduum, eo autem circulo positionis deinceps utar tanquam Horizonte regionis habentis latitudinem 6. graduū.

Intro igitur tabellam domorum rationalem cum 6. gradibus eleuationis poli, & ex directo eorum inuenio numerum polarem undecimæ 3. graduum, numerum autem polarem duodecimæ 5. graduum & 11. minutorum, quorum uice accipiam 5. gradus propter breuitatem.

Ascensio obliqua Solis ad latitudinem 6. graduum est 115. gradus & 42. minuta à qua ascensione subtrahō 30. gradus, & remanent 85. gradus cum 42. minutis, pro ascensione obliqua duodecimæ domus patris: item ex ascensione obliqua 12. minu. 30. gradus, remanent 55. gradus & 42. minuta pro ascensione obliqua undecimæ, à qua demum subtractis 30. manent 25. gradus cum 42. minutis pro ascensione recta decimæ domus.

Rursus per continuam additionem trigenorum graduum ad ascensionem obliquam ascendens, scilicet loci Solis, elicio ascensionem obliquam. 2. domus 145. graduum & 42. minutorum, ascensionem autem obliquam 3. domus 17. graduum & 42. minutorum.

Ex illis autem ascensionibus inuenio cuspides dictarum domorum, eisq; diametraliter positarum, quemadmodum in 14. problemate traditum est: decimæ quidem 27. gradus & 41. minuta Arietis, undecimæ autem 29. gradus, cum 2. minutis Tauri, duodecimæ 28. gradus & 4. minuta Geminarum, secundæ 24. gradus & 35. minuta Leonis, tertię uero 25. grad. & 25. minuta Virginis

VIGESIMVM QVINTVM PROBLEMA.

Significatorem quemlibet ad locum propositum quemcunq; secundum signorum seriem dirigere.

Dirige
re.

Priusquam ad operationem descendetur, nonnulla uocabula præsentis negotij diffinienda sunt. Dirigere non est aliud quam mouere spheram, donec locus secundus traducitur ad situm primi: id autem tunc accidere Ptolemæus clarissimus asserit, quando locus secundus perducitur ad circulum in quo iacuit locus primus, aut è contra locus primus transfertur ad circulum in quo ponebatur locus secundus.

Circulum dico coincidentem Meridiano & Horizonti in utraq; eorum communi sectione, quem superius circulum positionis appellare libuit.

Locum autem primum uoco eum, cuius notitia prior in mentem uenit, aut quem

quem dirigere iubetur: locus uero secundus est is, ad quem dirigitur primus.

Locus primus plerumque uocari solet significator, quod alicuius rei habitudinem in cœlo repræsentat, locus autem secundus non iniuria promissor appellabitur, quod futurum aliquod accidens siue bonum siue malum portendat. Significator itaque habet uicem subiecti recepturi aliquid à promissore in certo tempore, cuius quidem temporis quantitatem directio metiri solet, quemadmodum iudicibus placet.

Directio autem est motus primi mobilis, quo uidelicet significator traducitur ad situm promissoris, aut e contra.

Directio.

Solet tamen ut plurimum accipi directio pro arcu Aequatoris, qui coascendit uel condescendit interuallo, quod est inter significatorem & promissorem respectu circuli positionis, in quo alter eorum iacet: unde & dirigere tunc dicimur quando huiusmodi arcum doctè numerabimus.

Duplicem autem directionem distinguere solent Astrologi, quarum una quidem uocatur directio directa, in qua uidelicet locus secundus, id est promissor, intelligitur transferri ad situm primi, id est significatoris. Dicitur etiam directio secundum signorum successionem.

Duplex directio.

Alia autem uocatur conuersa, aut contra successionem signorum, in qua locus primus intelligitur transferri ad locum secundum: hac secunda directione utuntur iudices pro parte fortunæ ac alijs partibus, & pro planetis retrogradis.

Quando igitur significator in Meridiano constituitur siue supra terram, siue sub terra, subtrahere ascensiones eius rectas ab ascensionibus rectis promissoris, accommodato integro circulo 360. graduum si opus fuerit, & relinquetur directio significatoris quæsitæ.

Operatio.

Si autem fuerit in ascendente, minue ascensionem eius obliquam ex ascensione obliqua promissoris: sic enim reliqua manebit directio significatoris quæsitæ.

Non aliter operaberis per descensiones si significator fuerit in occidente: subtracta enim descensione obliqua significatoris à descensione obliqua promissoris, relinquetur directio quæsitæ.

Verum si significator non fuerit, in aliquo dictorum angulorum, per 19. problema scias distantiam eius ab angulo medijs cœli, si fuerit supra terram, aut ab angulo terræ si sub terra extiterit.

Deinde per 20. problema eleuationem poli borealis supra Horizontem significatoris, aut circulum positionis addiscas, postea ad eandem eleuationem poli computa ascensionem obliquam significatoris, per septimum quidem problema, si latitudine caruerit significator ipse, per decimum autem si quam habuerit latitudinem.

6 *Similiter*

Similiter ad eandem elevationem poli, ascensio obliqua promissoris inueniatur: demptaq; ascensione obliqua significatoris ex ascensione obliqua promissoris, residuum numerabit directionem quaesitam.

Si autem significator fuerit in parte occidentali coeli, descensio obliqua significatoris ad eandem elevationem poli supra circulum positionis accepta, per octauum quidem problema si nullam habuerit latitudinem, per undecimum autem si quam habuerit latitudinem: descensio inquam minuenda est ex descensione obliqua promissoris eodem modo accepta, sic enim relinquetur directio quam quaerebas. Nulla prorsus exemplari computatione hic est opus, si ea, quae circa ascensiones ac descensiones iam dudum monuimus, & operati sumus, recte didicisti.

VIGESIMVM SEXTVM PROBLEMA.

Quo pacto significator cuiuspiam contra signorum successionem dirigendus sit lucubrare.

Directio significatoris cuiuspiam contra signorum successionem similis est directioni secundum signorum consequentiam, hoc uno considerato, quod ascensiones & descensiones accipiantur secundum positionem promissoris, & non significatoris, ac si promissor dirigendus esset ad locum significatoris.

Sic enim subtrahemus ascensiones rectas promissoris ab ascensionibus rectis significatoris, si in Meridiano constitutus fuerit promissor: ascensiones autem obliquas promissoris ad latitudinem regionis sumptas ab ascensionibus obliquis significatoris, si promissor in ascendente iacuerit, aut descensiones huius a descensionibus illius si angulum occidentis tenuerit promissor, & relinquetur directio expectata.

Quod si nullus dictorum angulorum promissorem habuerit, inuenta prius elevatione poli borealis supra circulum positionis suae, subtrahemus ascensiones obliquas ipsius, ad eandem poli elevationem sumptas ab ascensionibus obliquis significatoris, si in medietate orientali fuerit promissor: aut descensiones eius obliquas a descensionibus obliquis significatoris ad eandem poli elevationem acceptis, accommodato integro circulo 360. graduum, quotiens opus fuerit, quod enim relinquetur, directionem ostendit quaesitam.

VIGESIMVM SEPTIMVM PROBLEMA.

Ad quem locum Zodiaci directio significatoris cuiuspiam secundum signorum successionem perueniat, in aliquo anno proposito inuestigare.

S I in radice natiuitatis uel alterius principij fuerit significator in Meridiano, siue supra terram, siue sub terra, ascensioni rectæ eius adde numerum annorum transactorum ab instanti talis radicis, id est pro quolibet anno exacto unum gradum Aequatoris dictæ ascensioni rectæ adijcias, & aggregati tanquam ascensionis rectæ quære arcum eclipticæ, reiecto prius integro circulo si opus fuerit, directo enim significatoris memorati in anno sequenti eos annos quorum numerus additus est ascensioni rectæ præfatae perueniet ad gradum qui sequitur immediatè arcum eclipticæ iam inuentum.

Si autem significator fuerit in ascendente, numerum annorum transactorum adde ascensioni obliquæ significatoris ad regionem propositam: aggregatum enim erit ascensio obliqua cuiusdam arcus eclipticæ, cui immediate annectitur gradus ad quem perueniet directio.

Cum igitur arcum eclipticæ per tabulam regionis agnoscas, non aliter operaberis per descensiones significatoris si in occidente extiterit: numero enim adiecto descensionibus obliquis significatoris prodibit descensio obliqua arcus eclipticæ terminali, ad gradum directionis quæsitum.

At si significator extra angulos dictos repertus fuerit, cognoscenda est eleuatio poli borealis supra circulum positionis aut Horizontem eius: deinde ascensionibus obliquis eius ad Horizontem eundem addatur numerus annorum propositorum, si in medietate orientali manserit significator: aut descensionibus eius in eodem Horizonte, si in occidentali parte cœli iacuerit. Hoc enim pacto conflabis uel ascensionem obliquam, uel descensionem arcus eclipticæ quem immediate sequitur gradus directionis quæsitus: huiusmodi autem arcum eclipticæ per tabulam Horizonti significatoris seruientem, ac deinde gradum ad quem perueniet directio, facile concludes.

VIGESIMVM OCTAVVM PROBLEMA.

Quo pertingat directio significatoris propositi contra successionem signorum in anno quocunq; explorare.

C Ognito prius arcu semidiurno significatoris cum arcu seminocturno per duodecimum problema, subtrahere numerum annorum exactorum ab ascensione recta significatoris, itemq; residuum ab ascensione recta mediæ cœli, accommodato integro circulo ubi opus fuerit, & residuum numerabit elongationem significatoris à meridie, quam habet dum positio sua similis est positioni promissoris, id est gradus quæsitus.

c 2 Huius

Huiusmodi igitur elongationem, si minor fuerit arcu semidiurno significatoris, pro distantia à Meridiano supraterranea occidentali tenebis.

Si uero maior arcu semidiurno significatoris fuerit, minor tamen semicirculo eam ex semicirculo deme, & relinquetur distantia significatoris à Meridiano subterranea occidentali.

At si maior fuerit semicirculo, semicirculus ex ea minuatur, & residuum si minus arcu seminocturno extiterit, pro distantia à Meridiano subterranea orientali computetur.

Si autem arcum seminocturnum excefferit, dempto eo ex semicirculo, quod relinquetur distantia à Meridiano supraterranea orientali nuncupabitur.

Iam igitur cum declinatione significatoris & distantia à Meridiano per uigesimum problema elevationem poli borealis supra circulum positionis addisce, ac deinde ascensionem obliquam significatoris, per septimum quidem problema si latitudine caruerit significator, per decimum uero si quam habuerit latitudinem, quemadmodum superius explanatum est, si saltem memorata distantia à Meridiano fuerit orientali.

Ex hac demum ascensione obliqua minue numerum annorum ab instanti radicis transactorum, & residuo tanquam ascensioni obliquæ congruentem arcum eclipticæ elicias per nonum problema. Nam ad gradum finalem huius arcus eclipticæ perueniet directio significatoris in anno proposito.

Si autem sæpe nominata distantia à Meridiano fuerit occidentalis, accipe descensionem obliquam significatoris, per octauum quidem problema si latitudine caruerit, per undecimum autem si latitudinem quantamcumque habuerit: ex qua denique descensione obliqua minue numerum annorum exactorum, à tempore radicis usque ad annum propositum exclusiue: & residuum erit descensio quædam obliqua, cui per nonum problema arcum eclipticæ elicias, nam gradus eius terminalis erit locus directionis quem petebas.

Exemplum. In exemplo habeat pars fortunæ 25. gradus Virginis, in genitura cuiusdam hominis ad latitudinem 48. graduum, medium autem cœli sit finis 25. graduum & 30. minutorum Cancrī, uolo experiri quonam peruentura sit directio partis fortunæ in anno uigesimo quinto ætatis: inuenio arcum semidiurnum significatoris 92. graduum & 13. minutorum, arcum autem seminocturnum 87. graduum & 47. minutorum. Item ascensionem rectam significatoris 175. graduum & 25. minutorum, ascensionem autem rectam mediæ cœli 117. graduum & 28. minutorum.

Ex ascensione igitur recta significatoris demo 24. gradus annis pro transactis:

factis ab instanti genituræ, & relinquuntur 151. gradus cum 25. minutis, quos 24. demum subtrahō ascensione recta mediæ cœli, coasumptis 360. gradibus, et remanet elongatio significatoris à meridie 326. graduum & 3. minutorum: dum scilicet est in situ promissoris.

Ex hac demum elongatione minuo 180. gradus, relinquitur numerus 146. graduum & 3. minutorum: qui cum sit maior arcu seminocturno, necesse est significatorem esse supra terram in quarta orientali, dum uidelicet est in circulo positionis promissoris, quare subtrahō 146. gradus & 3. minuta à semicirculo 180. graduum, & relinquetur distantia significatoris à Meridiano, dum est in situ promissoris: quæ quidem distantia erit supraterranea orientalis.

Significator deniq; habet declinationem septentrionalem 2. graduum, cum qua, & prædicta distantia eius à Meridiano intro tabulam positionum ad 48. gradus latitudinis, & directè supra distantiam memoratam in fronte tabulæ inuenio 31. gradus, unde certior fio quòd polus borealis eleuetur 31. gradibus supra circulum positionis, aut Horizontem significatoris, dum est in situ promissoris.

Quare per tabulam ascensionum obliquarum subiectam 31. gradibus computo ascensionem obliquam significatoris 173. graduum & 12. minutorum, ex quo minuo 24. gradus pro 24. annis transactis ab hora genituræ, relinquuntur 149. gradus cum 12. minutis, & tanta est ascensio obliqua loci ad quem perueniet directio, cui ascensioni per tabulam 31. graduum eleuationis poli respondent 3. gradus & 30. minuta Virginis. Directio igitur perueniet in anno uigesimo quinto ad quartum gradum Virginis, quod erat exponendum.

VIGESIMVM NONVM PROBLEMA.

Tabulam positionum particularem pro quacunq; latitudine à 35. gradibus ad 60. inclusiuè articulariter componere.

Fecimus quatuor huiusmodi tabulas positionum particulares, unam quidem pro latitudine 42. graduum, aliam pro latitudine 45. tertiam pro latitudine 48. & quartam pro latitudine 51. graduum, tanquam suffecturas nobis ac alijs uiris studiosis artis nostræ amatoribus.

Quamuis autem saltum fecerimus per trinos gradus, ita quòd pro binis gradibus medijs proprias tabulas non constituerimus, licebit tamen uti tabula quapiam, principaliter quidem & condigne pro latitudine cui inscribitur, rationabiliter autem & prope uerum pro duabus latitudinibus collateralibus: quarum una quidem proximo minor est latitudine tabulam propriam habente, alia autem proximo maior ea. Sic tabula latitudini 42.

c 3 graduum

graduum inscripta duabus etiam latitudinibus 41. & 43. graduum, haud inique accommodabitur: tabula denique pro 51 gradibus contexta 50. & 52. gradibus seruiet: non aliter de duabus reliquis intelligendum est. Quo circa ad latitudines 12. graduum, continue sese sequentium memoratae quatuor tabulae accommodari poterunt.

Si tamen praecisius per has etiam quatuor tabulas operari uolueris latitudine tuae regionis propriam tabulam non habente,

Accipe primo elevationem poli supra circulum positionis, ueluti iam dudum praecipimus, per tabulam latitudinis proximo minoris tua latitudine.

Deinde similiter accipe elevationem huiusmodi per tabulam latitudinis proximo maioris, nam tertia pars differentiae duarum elevationum hoc pacto inuentarum uni gradui latitudinis respondebit, eam itaque partem semel accipe pro uno gradu superfluo ultra numerum latitudinis minoris, bis autem pro duobus.

Si demum minuta iuxta gradus integros iacuerint, accipe partem proportionalem de tertia parte praedicta, secundum proportionem minutorum residuorum ad 60, quam adde portioni unius gradus, aut duorum iam pridem inuentae: aut eam solam tene, si nullus gradus sed minuta duntaxat ultra latitudinem minorem abundauerint, & habebis portionem respondentem superfluo latitudinis tuae ultra latitudinem minorem, eam portionem adde elevationi poli primae, si ipsa minor fuerit secunda, aut ab ea subtrahe si ipsa excesserit secundam, & resultabit eleuatio poli supra circulum positionis quam quaerebas.

Quod si operatio talis uel scrupulosa uel minus iucunda uidetur, poteris exarare nouam ac propriam tabulam latitudini tuae.

Huius enim rei gratia tabulam positionum generalem conscripsimus a 35. gradibus latitudinis incipientem & ad 60. desinentem.

Si autem ad latitudinem quampiam inferiorem 35. gradibus, aut superiorem 60. gradibus, id ipsum libeat efficere, secundus problematum almagesti consulendus est, ubi exactissime docetur, quo pacto et generalis positionum tabula, & particularis componi debeant.

In huius autem tabulae generalis latere sinistro ponuntur numeri eleuationum poli supra circulos positionum, sed in fronte eius latitudines regionum a trigintaquinque gradibus usque ad sexaginta quaerendae sunt: area autem tabulae arcus Aequatoris Meridiano & circulis positionum interceptos complectitur.

Conditurus igitur tabulam positionum particularem, scribe primo sinistram uersus duos ordines declinationum, primum quidem declinationis septentrionalis a 32. incipientem, ad nihilque desinentem, stella enim in
Aequas

Aequatore existens nullam habet declinationem, secundum autem ordinem declinationis meridianæ ex uno quidem gradu nascentem, & ad 32. finientem. In altero enim horum ordinum quæri debet declinatio stellæ, quemadmodum superius traditum est. In capite autem exarandæ tabulæ scribe numeros elevationum poli, ab uno quidem initium sumentes, ad latitudinem autem regionis tuæ desinentes.

Deinde intra tabulam generalem cum elevatione poli unius gradus, & ex directo eius sub latitudine regionis tuæ offendes arcum quendam Aequatoris, quem adde singulis numeris in tabula differentiarum ascensionum repertis sub elevatione poli unius gradus, incipiendo iuxta 32. gradus declinationis, & aggregata huiusmodi per ordinem scribe in area tabulæ contexendæ sub elevatione poli unius gradus, initium uidelicet statuendo iuxta 32. gradus declinationis. In fine autem huius ordinis scribe prædictum arcum Aequatoris solitarium: sic primum ordinem septentrionalem unius gradus absolutum habebis.

Postea ab arcu Aequatoris memorato subtrahe singulas differentias ascensionum prædictas, incipiendo iuxta declinationem unius gradus, & residua scribe iterum in area tabulæ exarandæ sub elevatione poli unius gradus, initium sumendo apud declinationem unius gradus: hoc itaq; pacto primus ordo meridionalis unius gradus constituetur.

Non autem aliter procedas ad descriptionem duorum ordinum, quos requirit elevatio poli duorum graduum.

Sumpto enim arcu Aequatoris per tabulam generalem, ex directo duorum graduum lateris sinistri, sub latitudine uidelicet regionis tuæ, eum arcum adde singulis differentijs ascensionum sub elevatione poli duorum graduum positis, & summas additionum scribe in area tabulæ componendæ sub elevatione poli duorum graduum, incipiendo iterum apud 32. gradus declinationis septentrionalis: in fine autem huius ordinis arcum Aequatoris quem addidisti pone solum, sicq; habebis ordinem secundum declinationis septentrionalis.

Ex eodem insuper arcu Aequatoris deme singulas differentias ascensionum prædictas, sub elevatione poli duorum graduum inuentas. & residua scribe iterum in area tabulæ condendæ sub elevatione poli duorum graduum, incipiendo iuxta declinationem unius gradus, hoc etenim præcepto secundum ordinem declinationis meridianæ constitues pariformiter cæteros ordines, & tandem integram tabulam positionum regioni tuæ absolues.

Exemplum autem hic nullum expectandum est, cum ante oculos habeas

as tabulam positionum generalem, & quatuor tabulas positionum particulares construere poteris.

Absolutam igitur habes artem directionum, cuius gratia potissimum hoc scribendi officium assumpsimus. Nunc de aspectibus quoque & radiationibus differendum uidetur, quæ res non modo ad directiones pertinet, uerum etiam ad profectioes significatorum, quam ob rem prius de profectioibus pauca quædam exponentur, de hinc ad aspectus & radiationes calamum uertemus.

VIGESIMVM PROBLEMA.

Quo pertingat profectio significatoris cuiuspiam in tempore aliquo dato, explorare.

Profectio. **P**rofectio est æqualis quædam aut regularis incessio significatoris secundum signorum Zodiaci consequentiam.

Triples profectio. Tripliciter autem proficiscuntur significatores genituræ cuiuslibet, uti placet Ptolemæo circa finem quadripartiti sui, per annos uidelicet, menses, & dies.

Profectio annua. In profectioe annua unicuique anno solari tribuitur signum unum, & si genitura quæpiam habet in ascendente signum Arietis, secundus annus habebit signum Tauri, tertius signum Gemorum, & sic consequenter per ordinem annorum & signorum, usque ad 12. annum, tertiusdecimus item annus habebit Arietem.

Initia autem annorum sumuntur à reditu Solis ad eum locum, in quo erat tempore genituræ, qui ob eam rem anni solares nuncupantur.

In principiis uero omnium annorum ac mensium gradus omnium signorum profectiois æquales esse oportet: unde si tertius Arietis ascenderet in genitura quæpiam, ascendens proficisceretur ad tertium Tauri in secundo anno, & ita de cæteris.

Mensurna. In profectioe autem mensurna unicuique mensi profectioali datur signum unum, ita quod signum profectiois annuæ sit signum primi mensis eiusdem anni: quam ob rem annus solaris in tredecim partes æquales diuidendus est, quarum unaquæque uocabitur mensis profectioalis.

Diurna. In profectioe autem diurna duobus diebus tribus horis & 52. minutis ferè datur signum unum, ita quod mensis profectioalis subdiuiditur in 13. partes æquales. Sic enim in principiis mensium profectioalium idem erit signum mensurnæ.

De annua profectioe. De profectioe itaque annua hoc breue accipias, diuiso numero annorum

rum transactorum à tempore genituræ per 12. & residuo computato à signo radicis, perduceris ad signum profectiois anni propositi.

Quo autem pertingat profectio mensurna ad quodcuncq; tempus propositum in aliquo anno, sic intelliges.

Primo scias quantum tempus effluxerit ab initio anni solaris currentis, anni scilicet reuolutionis genituræ usq; ad tempus propositum, quod computabis hoc pacto.

Vide quantum tempus præterit ab initio mensis usualis, in quo fit reuolutio natiuitatis usq; ad principium anni reuolutionis, hoc est ad diem eiusdem in quo incepit reuolui, & numerum dierum cum horis & minutis adde numero dierum reperto iuxta mensem usualem immediatè præcedentem in tabella mensium usualium.

In prima quidem si fuerit annus communis, in secunda autem si bisextilis extiterit, hoc tempus serua per totum annum solarem.

Similiter addisce quantum tempus effluxit ab initio anni Romanorum, usq; ad tempus propositum, dempto itaq; tempore prius seruato, ex iam nunc inuento tempore reuolutionis, relinquetur tempus transactum ab initio anni reuolutionis usq; ad tempus propositum.

Illud tempus quære in tabula mensium profectioalium, ueluti fieri solet, quando per medium motum cuiuscuncq; planetæ quæritur tempus ei motui respondens.

Si enim precise inueneris in tabella prædicta dies tuos cum horis & minutis, linea numerorum ostendet numerum mensium profectioalium transactorum ab initio anni reuolutionis currentis.

Si autem non inueneris precise, apud dies proximo pauciores habebis menses exactos, ueruntamen dies huiusmodi pauciores demendi sunt ex diebus tuis quos in tabulam mittere uoluisti, & relinquuntur dies superflui cum horis & minutis. Dabis itaq; cuilibet mensi profectioali signum unum, incipiendo à signo profectiois annuæ, dies autem superfluos cum horis & minutis mitte in tabulam profectiois mensurnæ, ex directo (ut fieri solet in medijs motibus computandis) habebis gradus cum minutis addendos signis & gradibus prius notatis, sicq; perduceris ad locum Zodiaci, quo perueniet profectio in fine totius temporis transacti, quod si modo prædicto cum diebus superfluis ingressus fueris tabulam profectiois diurnæ, elicies numerum signorum & graduum computandorum à signo profectiois mensurnæ, ut perducaris ad locum profectiois.

Vice uersa autem, si qua suspitio fuerit alicuius futuri accidentis propter corpus, uel radium alicuius stellæ, & uolueris scire quo tempore anni profectio qualiscuncq; illuc perueniat, cognito interuallo Zodiaci quod est à principio signi profectiois annuæ usq; ad locum suspectum, inuenies
tempus

tempus ei respondens, quemadmodum in opere mediorum motuum fieri solet, quando medio motui dato tempus suum computare uolumus: quid multis moror? Exemplari computatione facilius rem hanc intelliges, quam longa uerborum serie.

Sic reuolutio alicuius natiuitatis 6. diebus 5. horis & 10. minutis Martij, completis anno Christi 1467. corrente, locus autem Solis tempore geniturae fuerit in fine uigesimi quinti gradus Piscium, quae genitura ponatur fuisse anno Christi 1438. corrente, uolo inuestigare loca profectiois Solis ad 7. dies Iulij completos in anno 1467. corrente.

Subtraho 1438. a 1467. remanent 29. anni solares completi, quibus diuisis per 12. relinquuntur 5. sed quintum signum ab Ariete est Leo, illic ergo scilicet in 25. gradu Leonis, est locus profectiois annuae in ultimo dierum annorum, quare in anno trigesimo, qui incipit 6. die 5. hora 10. minuto Martij profectio pertinet ad 26. Virginis, quia profectio mensurnam iuxta Februarium inuenio 59. dies, quibus addo 6. 5. 10. Martij colliguntur 65. 5. 10. a principio uidelicet, anni 1467, ad initium anni reuolutionis trigesimali.

Similiter apud Iunium reperio 181. dies, quibus addo 7. dies Iulij, & resultant 188. dies a principio anni 1467. usque ad tempus profectiois. Subtraho itaque 65. 5. 10. a 188. & remanent mihi 122. 18. 50. quos non reperio in tabella mensium profectiois, sed numerum proximo minorem 112. 9. 10. 28. subtraho a diebus praedictis, & relinquuntur 10. 9. 39. 32. ultra quatuor menses profectiois: mensis ergo quintus currens habet quintum signum a signo profectiois annuae, id est, Capricornum, incipiendo a uigesimo quinto gradu eius

Postea intro cum diebus superfluis & horis ac minutis horarum, accipiendo signa gradus & minuta, quemadmodum fieri solet in computationibus mediorum motuum, sic inuenio 11. 6. 28. quos addo 25. gradibus Capricorni proueniunt 6. 6. 28. Aquarum, locus scilicet profectiois mensurnae ad 7. dies Iulij completos.

Similiter cum diebus superfluis intro tabulam profectiois diurnae, & inuenio 4. 24. 23. 55. computanda a 25. gradibus Capricorni, & resultat 2. 19. 23. 55. profectio igitur diurna conuocans etiam profectiois mensurnam perueniet in fine 7. diei Iulij ad 20. graduum Geminarum.

Verum ut loca profectiois habeantur parata ad singulos dies totius anni, sic procedo, subtraho 5. horas 10. minuta, quae erant iuxta dies reuolutionis

Iutionis genituræ a 24. horis, remanent. 18. 50. cum quibus intro tabulam profectiois mensurnæ, & modo supra dicto colligo 0. 50. 16. 28. illud addo 25. gradibus Leonis, resultant 25. 50. 16. Leonis. Hic est locus profectiois mensurnæ, quam uocant etiam profectioem graduum ad Meridiem 7. diei Martij, cui loco addo portionem profectioalem unius diei, quæ est unus gradus. 4. minuta & 4. secunda, & proueniunt 26. 54. 20. Leonis, locus scilicet profectiois ad Meridiem diei octauij Martij, & sic consequenter usq; ad finem totius anni.

Similiter cum 18. horis & 20. minutis per tabulam profectiois diurnæ inuenio 10. 53. 34. quos addo 25. gradibus Leonis, resultant, 5. 53. 34. Virginis, locus scilicet profectiois diurnæ ad Meridiem 7. diei Martij. Deinde per additionem continuam portionis profectioalis diurnæ, quæ est 13. 52. 52. loca profectiois diurnarum ad Meridies singulorum dierum totius anni constitues.

Quemadmodum autem huc usq; circa Solem actum est, de reliquis quoq; significatoribus fiet, quorsum tandem huiusmodi profectioes tendant, & quantam habeant efficaciam, alibi satis contemplaberis.

TRIGESIMVM PRIMVM PROBLEMA.

De Aspectibus tandem & radiationibus pauca quedam subiungere.

Radiationes a nonnullis perpenduntur secundum Aequatorem circulum, quamuis diuersimode, pleriq; enim per ascensiones rectas locum radiationis inquirunt, siue stella radians in Meridiano fuerit, siue extra eum in quocunq; alio situ, pro radiatione enim sextili sinistra ascensioni rectæ ipsius stellæ addunt 60. gradus, & per ascensionem rectam inde resultantem quærent arcum eclipticæ, cuius finem dicunt esse locum radiationis: pro radiatione autem sextili dextra subtrahunt 60. gradus ab ascensione recta stellæ, & cum residuo ut prius quærent arcum eclipticæ, ad cuius finem radiationem huiusmodi desinere arbitrantur.

Non aliter faciunt præ cæteris radiationibus addendo uel minuendo interualla unicuiq; radiationi propria. Alij autem exæquuntur id negotium per ascensiones quidam rectas stella Meridianum tenente, per obliquis autem ascensiones regionis si in oriente extiterit, aut per descensiones si in occidente. In locis autem medijs si reperta fuerit stella, radiationes inquirunt per ascensiones promiscuas, ac si uelint scrutari locum, ad quem pertingit directio stellæ propositæ.

Sunt

Sunt etiam qui simpliciter considerant radiationes per interualla graduum eclipticæ. Ioannes autem Blanchinus in circulo quodam super eclipticam inclinato, & per centrum stellæ habentis latitudinem quantamcumque transeunte accipit interualla radiationum aut aspectuum, cuius quidem circuli polus uterque est in circulo latitudinis stellæ: ex quibus denique interuallis loca radiationum in ecliptica elicit.

Longum esset particulariter explicare prædictos modos, ac infirmitatem eorum demonstrare, quare alibi abundius de his rebus tractare decretum est. Nunc uero breuiter intelligatur fundamentum nostræ opinionis, quælibet stella diffundit radium suum tam luminis quam qualitatis occultæ orbiculariter: cum autem infiniti sint tales radij efficaciores, de præhensi sunt quatuor quorum unus quidem est latus sexanguli æquilateri inscripti circulo per centrum stellæ transeunti, alius autem latus quadrati, tertius autem latus trianguli æquilateri, quartus uero diameter eiusdem circuli.

Quicquid autem hic dicitur de stellis, intelligendum quoque est de punctis Zodiaci, aliisque punctis in concauo primi mobilis existentibus, sub quibus stellæ ipsæ reperiuntur.

Sermo igitur præfens sonabit, ac si centra omnium stellarum sint in concauo primi mobilis, neque id iniuria, cum in eo concauo loca stellarum consideremus.

Imagino itaque a puncto cœli quopiam duci lineam radialem, quæ sit æqualis lateri sexanguli æquilateri circulo magno primi mobilis inscripti, eamque circumduci puncto radiante immoto, donec ad situm unde moueri coepit redeat, ita tamen quod reliquus lineæ terminus semper adhæreat concauo primi mobilis: hoc pacto punctus terminalis lineæ memoratæ in concauo cœli describet circumferentiam circuli, quæ si secat eclipticam, eam in duobus punctis secat, quorum alterum quidem est ad dextram, alterum autem ad sinistram, hæc duo puncta sunt loca radiationis sextilis per excellentiam quandam, quamuis etiam ad omne punctum circumferentiæ descriptæ radius dictus sextilisterminetur.

Similiter intelligendum est de linea radiationis quadratæ, ac radiationis triangularis.

Cum ergo scire uolueris locum radiationis sextilis planeta habente latitudinem, intra tabellam radiorum cum latitudine planetæ & ex directo eius inuenies arcum quendam eclipticæ computandum a loco longitudinis planetæ, secundum successionem quidem signorum pro radiatione
ne sine

ne sinistra, contra successionem autem pro radiatione dextra; cum des-
nitq; arcum minue ex 180. gradibus, & residuum numera à loco longi-
tudinis planetæ utrunq; pro radiatione triangulari. Locus autem radi-
ationis quadratæ semper distat à loco longitudinis planetæ per quadran-
tem eclipticæ. Radiatio demum opposita ad terminum diametri des-
sinit. De radiationibus itaq; ac aspectibus pauca quæ-
dam recensere, ac tandem præsentî nego-
tio finem libuit impos-

nere.
